# Synthesis of Biologically Active Heterocycles and Development of New Organometallic Methodologies 

David M. Arnold, M.S.
University of Pittsburgh, 2010

The study of the synthesis of highly functionalized heterocyclic compounds represents an important subset of synthetic organic transformations leading to target compounds with a wide set of applications in medicinal chemistry, biological chemistry, materials sciences and natural product synthesis. Through this work, synthetic strategies leading to a novel set of ester linked substituted quinoline - uracil scaffolds have been developed and the resulting products were found to be inhibitors of MPK1, an important target in cancer research. This work has also led to the development and implementation of novel synthetic strategies toward highly functionalized, traditionally pharmacologically important 6-amino-, 6-hydroxy- and 6-oxo-uracil and 4,6dihydroxypiperidone scaffolds. A novel Plk1-PBD inhibitor from this series would be important to probe the mechanism of this enzyme during mitosis and to develop a clinical candidate for this validated cancer target. The Plk1-PBD research endeavor also documents a case for a tandem synthetic/analytical structure determination study. The structure of an initially elusive compound from a high throughput screening of 97,090 compounds was determined by this approach.

Finally, the utility of novel heterocyclic sulfonyl and sulfinyl nitrogen protecting groups has been demonstrated through the addition of organometallic reagents to 2 -methylthiadiazole-, 2-benzothiazolesulfonylbenzaldimines and 2-pyridylsulfinylbenzaldimines. It was found that these addition reactions proceeded with a variety of organometallic
nucleophiles including Gringnard reagents, organozinc and organocuprates. The heterocyclic sulfonyl protecting groups were easily cleaved from the $\alpha$-branched amines, affording a useful protecting group strategy for the synthesis of this important class of compounds.

## TABLE OF CONTENTS

TABLE OF CONTENTS ..... VI
LIST OF TABLES ..... XI
LIST OF FIGURES ..... XII
LIST OF SCHEMES ..... XIV
ACKNOWLEGEMENTS ..... XVII
ABBREVIATIONS ..... XVIII
1.0 SYNTHESIS AND BIOLOGICAL ACTIVITY OF A FOCUSED LIBRARY OF
MITOGEN-ACTIVATED PROTEIN KINASE PHOSPHATASE INHIBITORS ..... 1
1.1 INTRODUCTION ..... 1
1.1.1 Brief biological background ..... 1
1.1.2 Project background ..... 2
1.1.3 Library design ..... 4
1.2 LIBRARY SYNTHESIS ..... 5
1.2.1 Synthesis of 2,8-substituted quinolinecarboxylic acid sodium salts ..... 5
1.2.2 Synthesis of 1- N -alkyl-3- N -alkyl-5-chloroacetyl-6-aminouracils ..... 8
1.2.3 Synthesis of the final library compounds ..... 11
1.3 BIOLOGICAL RESULTS FOR MKP-1 INHIBITORS ..... 15
1.4 CONCLUSIONS ..... 19
2.0 ADDITION OF ORGANOMETALLIC REAGENTS TO NOVEL
HETEROCYCLIC SULFONYL AND SULFINYL BENZALDIMINES ..... 20
2.1 INTRODUCTION ..... 20
2.1.1 Overview of imines ..... 20
2.1.2 Addition of organometallic reagents to imines ..... 23
2.1.2.1 Organolithium and Grignard reagents ..... 23
2.1.2.2 Dialkylzinc reagents ..... 27
2.1.2.3 Hydrozirconation and transmetallation. ..... 30
2.1.3 Introduction to Bts and Ths sulfonyl protecting groups ..... 34
2.2 RESULTS AND DISCUSSION. ..... 35
2.2.1 $\quad$ Synthesis of $\boldsymbol{N}$-Bts- and $\boldsymbol{N}$-Ths-benzaldimines ..... 35
2.2.2 Addition of organometallic reagents to the $N$-Bts- and $N$-Ths-
benzaldimines ..... 37
2.2.2.1 Lithium reagents ..... 37
2.2.2.2 Grignard reagents ..... 38
2.2.2.3 Diethylzinc reactions ..... 40
2.2.2.4 Hydrozirconation - transmetallation reactions ..... 41
2.2.3 Deprotection of $\boldsymbol{N}$-Ths and $\boldsymbol{N}$-Bts-sulfonamides ..... 45
2.2.4 Addition of organometallic reagents to heterocyclic benzothiazole- andpyridyl-2-sulfinylbenzaldimines.47
2.3 CONCLUSION ..... 51
3.0 STRUCTURE ELUCIDATION AND SYNTHESIS OF A PUTATIVE POLO LIKE KINASE - POLO BOX DOMAIN (PLK1-PBD) INHIBITOR ..... 52
3.1 OVERVIEW ..... 52
3.2 INTRODUCTION ..... 52
3.2.1 Project Background ..... 55
3.3 IDENTIFICATION OF THE STRUCTURE OF SID 861574 ..... 57
3.3.1 Initial synthetic attempts toward the identification of SID 861574 ..... 57
3.3.1.1 Synthesis of the carboxylic acid analogue of 205 ..... 58
3.3.1.2 Synthesis of the isomeric 6-aminouracils 206 and 207 ..... 58
3.3.1.3 Synthesis of 6-aminouracil analogues 208 and 209 ..... 59
3.3.1.4 Synthesis of the 6-hydroxyuracil analogue 210 ..... 61
3.3.1.5 Conclusions of the initial synthetic attempt to identify the structure of SID 861574 ..... 62
3.3.2 Structure elucidation of SID 861574: Development of a controlledsynthesis of $N_{1}, N_{3}$-differentially-substituted 5-methylene-6-hydroxy uracils63
3.3.3 Positive identification of the structure of SID 861574 and biological
testing results against Plk1-PBD ..... 72
3.4 INVESTIGATIONS INTO THE SAMPLE COMPOSITION ..... OF
SID 861574 ..... 75
3.5 INVESTIGATIONS INTO THE DECOMPOSITION OF 260 AND
SID 861574 ..... 78
3.5.1 High temperature decomposition of SID 861574 ..... 79
3.5.2 Room temperature decomposition of $\mathbf{2 6 0}$ vs. SID 861574 ..... 82
3.6 INITIAL BIOLOGICAL TESTING RESULTS AGAINST PLK1-PBD ..... 85
3.7 IDENTIFICATION AND SYNTHESIS OF PUTATIVE IMPURITIES
FOUND IN THE BIOLOGICALLY ACTIVE BATCH OF COMPOUND 265,
DMA-NB245-3 ..... 87
3.8 FURTHER SYNTHESIS OF ANALOGUES FOR BIOLOGICAL
TESTING AGAINST PLK1-PBD ..... 99
3.9 SUMMARY ..... 100
4.0 EXPERIMENTAL PART ..... 102
4.1 GENERAL EXPERIMENTAL ..... 102
4.2 LIBRARY SYNTHESIS ..... 103
4.2.1 Synthesis of 2,8-substituted-quinolinecarboxylic acid sodium salts ..... 103
4.2.2 Synthesis of 1- N -alkyl-3- N -alkyl-5-chloroacetyl-6-aminouracils ..... 106
4.2.3 Synthesis of the 2,8 -substituted-4-quinoline carboxylic acids ..... 110
4.2.4 Synthesis of the 1-N-alkyl-3-N-alkyl-6-aminouracils ..... 116
4.2.5 Synthesis of the final library analogues ..... 126
4.3 ADDITION OF ORGANOMETALLIC REAGENTS ..... TO
BENZOTHIAZOLE AND METHYLTHIADIAZOLE ALDIMINES ..... 144
4.3.1 $\quad$ Synthesis of $\boldsymbol{N}$-Bts- and $\boldsymbol{N}$-Ths-benzaldimines ..... 144
4.3.2 Organometallic additions to $N$-Bts- and $N$-Ths-benzaldimines ..... 149
4.3.3 Deprotection of $\boldsymbol{N}$-Ths and $\boldsymbol{N}$-Bts-sulfonamides ..... 168
4.3.4 Addition of organometallic reagents to (E)-N-benzylidenebenzo[d]thiazole-2-sulfinamide and (E)-N-benzylidenepyridine-2-sulfinamide171
4.4 SYNTHESIS OF SID 861574 AND RELATED PLK1-PBD
INHIBITORS ..... 182
4.4.1 First generation analogues of SID 861574 ..... 182
4.4.2 Second generation analogues of SID 861574: Synthesis of $N_{1}, N_{3^{-}}$differentially-substituted-5-methylene-6-hydroxy uracils.................................... 206206
4.4.3 Synthesis and identification of the structure of SID 861574 ..... 223
4.4.4 Synthesis of SID 861574 decomposition products and other relatedanalogues.227
APPENDIX A. ..... 251

Scheme 49. Synthesis of diarylmalonamide analogues 292 and 293. ..... 100
Scheme 50. Synthesis of diaylurea analogues 294 and 295 ..... 100

## ACKNOWLEGEMENTS

I would like to thank my advisor, Professor Peter Wipf, for his guidance, encouragement and patience during my studies at the University of Pittsburgh. His inspiration has allowed me to develop as a scientist and has greatly deepened my appreciation for the art and application of synthetic organic chemistry. I would like to thank Professors Dennis Curran and Kazunori Koide for their useful discussions and helpful suggestions over the last five years. I would like to further thank Damodaran Krishnan and Sage Bowser for NMR assistance, Dr. John Williams for mass spectrometry assistance and Dr. Steven Geib for his valuable X-ray crystallography contributions. I would like to thank Dr. John S. Lazo and Dr. Paul A. Johnston for their biological contributions to the MKP-1 and Plk1-PBD projects and Dr. Donna M. Huryn for her valuable discussions on these projects. I would also like to thank Peter Chambers for his analytical LC/MS assistance that was instrumental in the Plk1-PBD project.

UV: Ultraviolet spectroscopy
VHR: Vaccinia virus related dual-specific protein phosphatase

### 1.0 SYNTHESIS AND BIOLOGICAL ACTIVITY OF A FOCUSED LIBRARY OF MITOGEN-ACTIVATED PROTEIN KINASE PHOSPHATASE INHIBITORS ${ }^{1}$

### 1.1 INTRODUCTION

The synthesis of a small library of mitogen-activated protein kinase phosphatase-1 (MKP-1) inhibitors and their resultant biological activity will be discussed. After a brief biological discussion, the background for the project is presented and the library design is introduced. The discussion focuses on the routes used for the synthesis of the library and the resulting biological data. The work in this chapter has appeared in reference 1.

### 1.1.1 Brief biological background

The family of mitogen-activated protein kinases (MAPKs) represents a class of evolutionary conserved enzymes which are involved in highly regulated signaling pathways within the cell. ${ }^{2}$ Mitogen-activated protein kinases play a crucial role in the regulation of cellular processes such as gene expression, cell proliferation, cell survival and cell death. ${ }^{2}$ In the MAPK signaling pathway, MKP-1 has been identified as a crucial regulatory enzyme whose function affects the outcome of many of these cellular processes, a result which has supported the role of MKP-1 as an important target for biological research. ${ }^{3}$ Resent studies have also shown MKP-1 to be a potentially significant target for cancer therapy since the gene is overexpressed in human lung, prostate, gastric, breast and pancreatic cancers. ${ }^{4,5}$

### 1.1.2 Project background

Over the last two decades, the increasing biological importance of MKP-1 as a crucial regulatory enzyme in MAPK signaling cascades and as a potentially important therapeutic target has spurred the search for a potent and selective MKP-1 inhibitor. Unfortunately, to this date, there is no crystal structure of the MKP-1 enzyme available to guide rational inhibitor design. Therefore, the identification of MKP-1 inhibitors has been the result of high throughput screening (HTS) efforts in conjunction with secondary MKP-1 cellular assays. ${ }^{6,7}$

In 2005, the University of Pittsburgh Department of Pharmacology reported sanguinarine as the first selective inhibitor of MKP-1, (1, Figure 1). Sanguinarine was identified via a high-content analysis of 720 natural products and was shown to selectively inhibit MKP-1 in vitro with an $\mathrm{IC}_{50}=17.3 \mu \mathrm{M}$ in comparison with other related dual-specificity phosphatases such as MKP-3 $\left(\mathrm{IC}_{50} \gg 100 \mu \mathrm{M}\right), \mathrm{Cdc} 25 \mathrm{~B}\left(\mathrm{IC}_{50}=57.8 \mu \mathrm{M}\right), \mathrm{VHR}\left(\mathrm{IC}_{50}=74.0 \mu \mathrm{M}\right)$ and PTP1B $\left(\mathrm{IC}_{50}=67.9 \mu \mathrm{M}\right) .{ }^{7}$ Sanguinarine was also found to preferentially inhibit MKP-1 over MKP-3 in intact HeLa cells, showing 1 to be active at the cellular level. ${ }^{7}$ Selective inhibition of MKP-1 over MKP-3 is a good criteria for general MKP-1 selectivity, given the structural homology between the catalytic domains of these two dual-specificity phosphatases in which the amino acid sequence is $82 \%$ identical. ${ }^{6}$ Utilizing the scaffold of sanguinarine, the authors investigated the inhibitory effect on MKP-1 of five other structurally similar compounds: chelerythrine 2, hydroxychelidonine 3, berberine 4, tetrahydroberberine 5 and protopine 6 (Figure 1), but only 2 was found to inhibit MKP-1 with comparable potency $\left(\mathrm{IC}_{50}=16.2 \mu \mathrm{M}\right) .^{7}$

1

6 IC $\mathrm{C}_{50}$ : >>100 $\mu \mathrm{M}$

Figure 1. Structure of sanguinarine and related analogues tested for MKP-1 inhibition. ${ }^{7}$

In 2006, a second paper demonstrated the potency of novel benzofuran based inhibitors of MKP-1, such as NU-126 (7, Figure 2). ${ }^{6}$ The potency of 7 was similar to that of $\mathbf{1}$, inhibiting MKP-1 with an in vitro $\mathrm{IC}_{50}$ value of $28.2 \mu \mathrm{M}$. ${ }^{6}$ The selectivity of 7 for MKP-1 versus other dual-specificity phosphatases was enhanced over that of $\mathbf{1}$, as demonstrated by the in vitro $\mathrm{IC}_{50}$ values of 7 for MKP-3 $\left(\mathrm{IC}_{50}>400 \mu \mathrm{M}\right), \mathrm{Cdc} 25 \mathrm{~B}\left(\mathrm{IC}_{50}>400 \mu \mathrm{M}\right), \mathrm{VHR}\left(\mathrm{IC}_{50}=38.1 \mu \mathrm{M}\right)$ and PTP1B $\left(\mathrm{IC}_{50}>100 \mu \mathrm{M}\right) .{ }^{6}$

Figure 2. Structure of NU-126 (7). ${ }^{6}$

In 2007, a high throughput screen of 13,309 compounds was conducted by the Pittsburgh Molecular Libraries Screening Center (PMLSC) to identify small molecule inhibitors of MKP1. ${ }^{1}$ Among the hits, a compound containing a linked quinoline-uracil scaffold was identified as an inhibitor of MKP-1 with an average $\mathrm{IC}_{50}$ value of $19.2 \pm 5.6 \mu \mathrm{M}\left(\mathbf{8}\right.$, Figure 3). ${ }^{1}$ The structure of $\mathbf{8}$ was unique among the HTS hits since it was the only quinoline-uracil based scaffold that was tested in this screen. ${ }^{1}$ This fact, along with the low $\mu \mathrm{M}$ in vitro potency of $\mathbf{8}$ and its relatively easily accessible structure encouraged the synthesis of analogues designed to systematically probe favorable binding interactions with MKP-1.

8

Figure 3. Structure of MKP-1 inhibitor 8.

### 1.1.3 Library design

It was envisioned that the dual-domain nature of scaffold $\mathbf{8}$ could be used to generate a small library of compounds in which the points of derivatization would be the uracil $N-1$ and $N-3$ positions and the quinoline 2 and 8 positions. Augmentation of alkyl substituent size at the uracil $N-1$ and $N-3$ positions was chosen to probe steric effects and possible hydrophobic interactions within the MKP-1 inhibitor binding domain. Variation at the uracil N-1 position
included methyl, methylcyclopropyl, iso-butyl and benzyl substituents. Variation at the uracil N 3 position included methyl and benzyl substituents. Derivatization at the quinoline 2 and 8 positions was intended to probe electronic and steric requirements. Variations at the 2-quinoline position included hydrogen, trifluormethyl, cyclopropyl, furanyl and phenyl substituents, while variation at the 8-quinoline position was chosen to include hydrogen and trifluoromethyl groups. This choice of substituents leads to a library of 26 compounds, including the original HTS hit 8.

Scheme 1. Main retrosynthetic disconnection for the library analogues.

### 1.2 LIBRARY SYNTHESIS

### 1.2.1 Synthesis of 2,8-substituted quinolinecarboxylic acid sodium salts

The 2,8-substituted quinolinecarboxylic acid sodium salts 9, 10, 11, 12, 13, and 14 were synthesized from their precursor quinolinecarboxylic acids 20, 21, 22, 23, 24 and 25 by reaction
with 1 equiv. of a $10 \% \mathrm{NaOH}$ solution according to Scheme $2 .{ }^{8}$ The resulting 2,8 -substituted quinolinecarboxylic acid sodium salts were isolated in yields ranging from $97-100 \%$.

Scheme 2. Synthesis of the quinolinecarboxylic acid sodium salts 9, 10, 11, 12, 13, and 14.

The quinoline-4-carboxylic acid 20 and the 2-phenylquinoline-4-carboxylic acid 24 were purchased from commercial sources. The 2-(trifluoromethyl)quinoline-4-carboxylic acid 21 and the 2,8-bis(trifluoromethyl)quinoline-4-carboxylic acid 25 were synthesized according to the route shown in Scheme 3.

31: $R^{1}=H, R^{2}=C F_{3}: 50 \%$
21: $R^{1}=H, R^{2}=C F_{3}: 53 \%$
32: $R^{1}=\mathrm{CF}_{3}, \mathrm{R}^{2}=\mathrm{CF}_{3}: 88 \%$
25: $R^{1}=C F_{3}, R^{2}=C F_{3}: 53 \%$

Scheme 3. Synthesis of the mono- and bis-(trifluoromethyl)-4-quinoline carboxylic acids 21 and 25.

The synthesis of 21 and 25 began with the PPA condensation and subsequent cyclization of ethyl 4,4,4-trifluoro-3-oxobutanoate 28 with either aniline 26 or 2-(trifluoromethyl)aniline $\mathbf{2 7}$ to generate 29 and 30 in $58 \%$ and $32 \%$ yield, respectively. ${ }^{9}$ Quinolines 29 and 30 were then reacted with $\mathrm{POBr}_{3}$ at $150{ }^{\circ} \mathrm{C}$, forming the corresponding 4-bromo-(trifluoromethyl)quinolines 31 and 32 in $50 \%$ and $88 \%$ yield, respectively. ${ }^{9}$ In the last step, a lithium-halogen exchange reaction was performed on the 4-bromo-(trifluoromethyl)quinoline compounds 31 and 32 by reacting them with a solution of 1.34 M butyllithium in THF at $-78{ }^{\circ} \mathrm{C}$. This reaction generated the corresponding 4-lithium-(trifluoromethyl)quinoline reagents, which were then carboxylated with $\mathrm{CO}_{2}$ (dry ice) and protonated with HCl to generate the final mono- and bis-(trifluoromethyl)-4-quinolinecarboxylic acids 21 and 25 in 53\% yield. ${ }^{9}$

The remaining two quinolinecarboxylic acids, 2-cyclopropylquinoline-4-carboxylic acid 22 and 2-(furan-2-yl)quinoline-4-carboxylic acid 23, were synthesized by using the

Pfitzinger reaction. ${ }^{10}$ Reaction of isatin 33 with either 1-cyclopropylethanone 34 or 2acetylfuran 35 in an 8.75 M solution of KOH at reflux, followed by subsequent acidification with concentrated HCl , generated 22 and 23 in $78 \%$ and $34 \%$ yield, respectively. ${ }^{11}$

Scheme 4. Synthesis of quinolinecarboxylic acids 22 and 23.

### 1.2.2 Synthesis of 1-N-alkyl-3-N-alkyl-5-chloroacetyl-6-aminouracils

The 1- $N$-alkyl-3- $N$-alkyl-5-chloroacetyl-6-aminouracils 15, 16, 17, 18 and 19 were synthesized from their precursor 1- $N$-alkyl-3- $N$-alkyl-6-aminouracils $36,37,38,39$ and 40 by reaction with 2-chloroacetyl chloride 41 in a mixture of pyridine and chloroacetic acid heated at $90-95{ }^{\circ} \mathrm{C}$ (Scheme 5). ${ }^{12} \quad 1-N$-Alkyl-3- $N$-alkyl-5-chloroacetyl-6-aminouracils were precipitated from the reaction mixtures at $0^{\circ} \mathrm{C}$ with deionized water and recrystallized from ethyl acetate and hexanes, affording the products 15, 16, 17, 18 and 19 in $53 \%, 67 \%, 47 \%, 35 \%$ and $72 \%$ yield, respectively.

36: $\mathrm{R}^{3}=\mathrm{CH}_{3}, \mathrm{R}^{4}=\mathrm{CH}_{3}$
15: $\mathrm{R}^{3}=\mathrm{CH}_{3}, \mathrm{R}^{4}=\mathrm{CH}_{3}: 53 \%$

38: $\mathrm{R}^{3}=$ methylcyclopropane, $\mathrm{R}^{4}=\mathrm{CH}_{3}$
17: $\mathrm{R}^{3}=$ methylcyclopropane, $\mathrm{R}^{4}=\mathrm{CH}_{3}: 47 \%$
39: $\mathrm{R}^{3}=$ iso-butyl, $\mathrm{R}^{4}=\mathrm{CH}_{3}$
18: $\mathrm{R}^{3}=$ iso-butyl, $\mathrm{R}^{4}=\mathrm{CH}_{3}: 35 \%$
40: $\mathrm{R}^{3}=$ benzyl, $\mathrm{R}^{4}=\mathrm{CH}_{3}$
19: $R^{3}=$ benzyl, $R^{4}=\mathrm{CH}_{3}: 72 \%$

Scheme 5. Synthesis of 1- $N$-alkyl-3- $N$-alkyl-5-chloroacetyl-6-aminouracils 15, 16, 17, 18 and 19.

The 1,3-N,N-dimethyl-6-aminouracil 36 and the 1- $N$-iso-butyl-3- $N$-methy-6-aminouracil 39 were purchased from commercial sources. The remaining three $1-\mathrm{N}$-alkyl-3-N-alkyl-6aminouracils 37,38 and 40 were synthesized according to the reaction sequence shown in Schemes 6 and 7, which was chosen to control the positioning of the alkyl substituents around the uracil ring.

42: $\mathrm{R}^{3}=$ benzyl
44: $R^{3}=$ benzyl: $58 \%$
43: $R^{3}=$ methylcyclopropane
45: $\mathrm{R}^{3}=$ methylcyclopropane: $76 \%$

1) $10 \% \mathrm{NaOH}$

47: $\mathrm{R}^{3}=$ benzyl: $75 \%$
49: $R^{3}=$ benzyl: $50 \%$

50: $R^{3}=$ methylcyclopropane: $36 \%$

Scheme 6. Synthesis of 1-N-alkyl-6-aminouracils 49 and 50.

For the synthesis of the $1-N$-alkyl-6-aminouracils 49 and 50, benzylamine hydrochloride 42 and methylcyclopropylamine hydrochloride $\mathbf{4 3}$ were reacted with KOCN in aqueous media to afford 1-benzylurea 44 and 1-(cyclopropylmethyl)urea 45 in $58 \%$ and $76 \%$ yield, respectively. ${ }^{13}$ The urea products 44 and 45 were then condensed with 2-cyanoacetic acid 46 at $77^{\circ} \mathrm{C}$ in acetic anhydride to produce the corresponding cyanoacetylureas 47 and 48 in $75 \%$ and $56 \%$ yields. ${ }^{14}$ The products 47 and 48 cyclized by treatment with $10 \% \mathrm{NaOH}$ in ethanol and water at $95{ }^{\circ} \mathrm{C}$, affording the 1-N-alkyl-6-aminouracils 49 and 50 in $50 \%$ and $36 \%$ yield upon acidification. ${ }^{14}$

Scheme 7. Synthesis of 1- $N$-alkyl-3- $N$-alkyl-6-aminouracils 37, 38 and 40.

The route for the synthesis of the $1-N$-alkyl-3- $N$-alkyl-6-aminouracils 37, 38 and 40 is shown in Scheme 7. The 1-N-methyl-6-aminouracil 51 was purchased from a commercial source. The amino functionality of $1-N$-alkyl-6-aminouracils $\mathbf{4 9}, 50$ and 51 was protected by the
way of DMF-DMA in DMF at $40{ }^{\circ} \mathrm{C}$, generating the $1-N$-alkyl- 6 [(dimethylamino)methylene]uracils 52, 53 and 54 in $76 \%$, $93 \%$ and $65 \%$ yield, respectively. ${ }^{15}$ The 1- $N$-alkyl-6-[(dimethylamino)methylene]uracils 52 and 53 were alkylated at the $N$ - 3 position by reaction with DBU and MeI in a mixture of MeCN and DMF at room temperature over a 2 d period, affording the $1-\mathrm{N}$-alkyl-3- N -methyl-6-[(dimethylamino)methylene] uracils 55 and 56 in $51 \%$ and $46 \%$ yield. ${ }^{15}$ The 1- $N$-methyl-6-[(dimethylamino)methylene]uracil 54 was alkylated at the $N-3$ position by reaction with DBU and BnBr in a mixture of MeCN and DMF at $80^{\circ} \mathrm{C}$ over a 5 h period, affording the $1-\mathrm{N}$-methyl-3- N -benzyl-6-[(dimethylamino)methylene]uracil 57 in $15 \%$ yield. Following the synthesis of 55, 56 and 57, the (dimethylamino)methylene group was removed by a solution of aqueous ammonia in methanol at room temperature over several days, affording the final $1-N$-alkyl-3- $N$-alkyl-6-aminouracils 40, 38 and 37 in $77 \%, 80 \%$ and $73 \%$ yield, respectively. ${ }^{15}$

### 1.2.3 Synthesis of the final library compounds

Segment assembly followed the route shown in Scheme 8. A convergent strategy for the final library of analogues was based on reacting six 2,8-substituted-4-quinolinecarboxylic acid sodium salts $9,10,11,12,13$ and 14 with five $1-N$-alkyl-3- $N$-alkyl-5-chloroacetyl-6-aminouracils 15, 16, 17, 18 and 19 through an $\mathrm{S}_{\mathrm{N}} 2$ reaction in DMF at reflux. ${ }^{8}$ The products were precipitated from the reaction mixture by the slow addition of deionized water while cooling to $0{ }^{\circ} \mathrm{C}$ over a 1 h period. The resulting library analogues were then dried in a Genevac solvent evaporator to remove residual traces of DMF. The 23 library components $\mathbf{5 8} \mathbf{- 8 0}$ were synthesized in yields ranging from $31-74 \%$ (Scheme 8). All of the final products were analyzed by ${ }^{1} \mathrm{H}$ NMR and RP LC/MS and were found to be $>85 \%$ pure by UV detection at 210 nm or $>90 \%$ pure by ELSD
with the exception of $\mathbf{6 3}$ which was found to be $>95 \%$ pure by ${ }^{1} \mathrm{H}$ NMR analysis. ${ }^{1}$ A total of 12 compounds were fully characterized by Mp, IR, ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR and HRMS. At least one compound containing each unique quinoline or uracil subunit was chosen for full characterization.

Scheme 8. Synthesis of the final MKP-1 inhibitor library.

Among the five $1-\mathrm{N}$-alkyl-3- N -alkyl-5-chloroacetyl-6-aminouracils, only the $1,3-\mathrm{N}, \mathrm{N}$ -dimethyl-5-chloroacetyl-6-aminouracil 15 was reacted with quinoline-4-carboxylic acid sodium salt 9. The resulting derivative 58 represents the simplest analogue used to probe the MKP-1 inhibitor binding domain. Analogue 58 was also readily constructed from commercially available starting materials (20 and 51) as a way to test the methodology proposed for synthesizing the $1-N$-alkyl-3- $N$-alkyl-5-chloroacetyl-6-aminouracils and the final library analogues. Only four of the 1- $N$-alkyl-3- $N$-alkyl-5-chloroacetyl-6-aminouracils 15, 16, 18 and 19 were reacted with the five 2,8-(substituted)quinoline-4-carboxylic acid sodium salts 10, 11, 12, 13 and 14. This was the result of a low overall yield for the synthesis of 17 ( $2 \%$ yield over 7 steps), which generated only enough material for the synthesis of two final library analogues. Therefore, $\mathbf{1 7}$ was reacted with $\mathbf{1 2}$ to allow for a direct biological activity comparison to the original hit 8, and was also reacted with $\mathbf{1 4}$ due to the known biological activity of the 2,8bis(trifluoromethy)quinoline substructure found in mefloquine, an antimalarial agent. ${ }^{16}$

### 1.3 BIOLOGICAL RESULTS FOR MKP-1 INHIBITORS

A total library of 47 compounds comprised of 23 fully-assembled analogues and 24 intermediate quinolines or uracils was submitted to the University of Pittsburgh Molecular Libraries Screening Center (UPMLSC) for testing against MKP-1. The 47-compound library was also registered on PubChem and the PubChem DMA-xyz compound names have been retained in the experimental section of this document. ${ }^{17}$ None of the quinoline- or uracil-based precursors were found to be active inhibitors of MKP-1, suggesting that both the quinoline and uracil subunits are
necessary for activity. The results of the enzyme assays have been published and are summarized in Table 1. ${ }^{1}$

Table 1. Biological Results ${ }^{\text {a }}$ Against MKP-1 and MKP-3. ${ }^{1}$

| 80 | 9547730 | $\mathrm{CF}_{3}$ | $\mathrm{CF}_{3}$ | Bn | $\mathrm{CH}_{3}$ | >50 | $>50$ |

Curiously, the resynthesized 73 suffered from an almost three-fold loss of potency with an $\mathrm{IC}_{50}$ value of $50 \mu \mathrm{M}$, versus $19.2 \mu \mathrm{M}$ for the original hit 8. The reasons for this loss of potency are unclear. The analogues $\mathbf{6 1}, 65,66,69$ and 78 showed an $\mathrm{IC}_{50}$ value comparable to

[^0]the original hit 8 (Figure 4). These five analogues also demonstrated selectivity for MKP-1 when compared to MKP-3. Analogues 61, 65, 66, 69 and 78 all inhibited MKP-3 with $\mathrm{IC}_{50}$ values $>50 \mu \mathrm{M}$.

78
$I C_{50}=13.4 \mu \mathrm{M}$

61
$\mathrm{IC}_{50}=20.6 \mu \mathrm{M}$

IC ${ }_{50}=24.6 \mu \mathrm{M}$

65
$\mathrm{IC}_{50}=28.9 \mu \mathrm{M}$

Figure 4. Library analogues found to inhibit MKP-1 with a similar potency as to the original hit.

A comparison of the structures for the five library analogues found to selectively inhibit MKP-1 shows some interesting trends leading to valuable structure activity relationship (SAR)
information about the binding of this novel class of quinoline-uracil based MKP-1 inhibitors. The alkyl substituents on the uracil $N-1$ and $N-3$ positions have only a modest effect on binding, with bulkier substituents, such as benzyl, being favored. Interestingly, both isomeric forms 78 and 66 of the benzyl-substituted aminouracil demonstrated tight inhibitor binding. This result suggests that a maximization of hydrophobic interactions at the position where the $N-1$ and $N-3$ alkyl substituents on the aminouracil sit in the inhibitor binding domain of MKP-1 may lead to a second generation library of more potent inhibitors.

The nature of the substituents on the quinoline ring system plays an important role in a tight binding of the quinoline-uracil analogues to MKP-1. Substitution at the 4-quinoline position was found to greatly decrease the $\mathrm{IC}_{50}$, as shown for analogues 63, 68, 70, 75 and 80. As seen in Figure 4, four of the five most potent inhibitors of MKP-1 retained the furan substituent at the 2-quinoline position. This result, in comparison to the 2-phenyl substituted quinoline analogues 62, 67, 74 and 79 , suggests that, at the position where the quinoline substructure rests in the inhibitor binding domain of MKP-1, potentially both steric and electronic effects govern inhibitor binding. This result suggests that a second-generation library of quinoline-uracil based MKP-1 inhibitors may be extended to include other heteroaromatic substituents at the 2-quinoline position such as thiophene, pyrrole, benzofuran, thiazole and pyridine.

### 1.4 CONCLUSIONS

Collaborative research efforts have exposed a novel class of quinoline-uracil based MKP-1 inhibitors, which were found to be selective for MKP-1 over MKP-3. The active inhibitors were found to inhibit MKP-1 with low $\mu \mathrm{M} \mathrm{IC}_{50}$ values comparable to those of the known inhibitors sanguinarine and NU-126. ${ }^{6,7}$ A library of analogs provided valuable SAR data for the design of this class of phosphatase inhibitors. These results can guide the development of new quinolineuracil based MKP-1 inhibitors.

# 2.0 ADDITION OF ORGANOMETALLIC REAGENTS TO NOVEL HETEROCYCLIC SULFONYL AND SULFINYL BENZALDIMINES 

### 2.1 INTRODUCTION

This chapter explores the reactivity of heterocyclic sulfonyl- and sulfinylbenzaldimines towards a variety of organometallic nucleophiles. The synthesis of these uniquely protected aldimines and cleavage of the resulting heterocyclic protecting groups to generate the corresponding $\alpha$ branched primary amine products are also discussed.

### 2.1.1 Overview of imines

The addition of organometallic carbon-based nucleophiles to the $\mathrm{C}=\mathrm{N}$ bond of imines represents an important class of carbon-carbon bond forming reactions that has been heavily investigated throughout the past fifty years. More recently, developments in this field have focused on the synthesis of $\alpha$-chiral amines through the asymmetric addition of organometallic reagents to imines. These asymmetric addition reactions have been shown to proceed effectively through the use of chiral auxiliaries and with both stoichiometric and catalytic amounts of chiral ligands. The success of these organometallic addition reactions is highly dependent on both the reactivity of the imine and on the nature of the organometallic reagent.

Imine reactivity is often mediated through the electron-withdrawing effects of the nitrogen atom substituent, a result which has led to the development of several classes of functionalized imines (Figure 5). ${ }^{18,19}$ It has been reported that, in general, the relative reactivities of these imines decreases in the order of $N$-acyliminium ions $>N$-acylimines >> $N$ sulfonylimines $>N$-phosphinoylimines $>N$-alkyl and $N$-arylimines. ${ }^{18,19}$ While the nature of the imine nitrogen atom substituent mediates the reactivity of the imine by controlling the electrophilicity of the $\mathrm{C}=\mathrm{N}$ carbon terminus, it also serves as a protecting group for the resulting amine products. ${ }^{18}$ Accordingly, it is important to be able to easily remove these protecting groups after the addition reaction.

N -alkylimines N -arylimines

Figure 5. Representation of several known classes of imines. ${ }^{18,19}$

Deprotection of $N$-acylamines such as the $N$-Boc and $N$-formyl amines, as well as $N$ phosphinoylamides and $N$-sulfinamides, can be generally accomplished under acidic conditions with HCl in protic solvents such as methanol. ${ }^{20-23}$ The deprotection of N -sulfonamides has
traditionally been performed under much harsher reaction conditions, by reactions with reagents such as sodium in liquid ammonia, sodium naphthalene in 1,2-dimethoxyethane, and with $\mathrm{SmI}_{2}$ and DMPU in THF at reflux. ${ }^{24-26}$ A milder method for the deprotection of primary N arylsulfonylamides requires the conversion of these products to their corresponding $t$-butyl N arylsulfonylcarbamates by a DMAP-catalyzed reaction with $\mathrm{Boc}_{2} \mathrm{O} .{ }^{27}$ The $N$-arylsulfonyl group can then be cleaved by reaction with Mg metal in methanol resulting in the corresponding $N$-Boc amines. ${ }^{27}$

87

88

Figure 6. Structures of Davis (87) and Ellman (88) $N$-sulfinylimines.

Among the several classes of imines shown in Figure 5, the $N$-sulfinylimines are unique in their ability to both activate the imine $\mathrm{C}=\mathrm{N}$ bond towards nucleophilic addition and, when synthesized enantiomerically pure, serve as chiral auxiliaries to direct the diastereofacial selectivity for the nucleophilic addition reaction. ${ }^{28}$ The most widely utilized $N$-sulfinylimines are the $N$-p-toluenesulfinyl imines 87, pioneered by Davis, and the $N$-tert-butanesulfinyl imines explored by Ellman (88, Figure 6). Recently, a general procedure for the synthesis of enantiopure $N$-sulfinamides 91 from enantiomerically pure $N$-sulfonyl-1,2,3-oxathiazolidine-2oxides 89 has emerged (Scheme 9). ${ }^{29}$ The resulting $N$-sulfinamides can be condensed with a variety of aldehydes or ketones in the presence of $\mathrm{Ti}(\mathrm{OEt})_{4}$ to form the enantiopure N sulfinylimines. ${ }^{28}$

Scheme 9. Asymmetric synthesis of $N$-sulfinamides. ${ }^{29}$

### 2.1.2 Addition of organometallic reagents to imines

The chemistry surrounding the addition of organometallic reagents to the imines listed above is rich in both scope and utility. Indeed, over the last few decades, many of these imines have been demonstrated to be excellent reaction partners for the addition of lithium, magnesium, zinc, copper, rhodium and aluminum based organometallic reagents. Also, more recently, asymmetric variants have been explored.

### 2.1.2.1 Organolithium and Grignard reagents

Organolithium and organomagnesium reagents have the dual properties of being good nucleophiles and strongly basic. The addition of these reagents to unactivated imines such as N alkyl or $N$-arylimines is often difficult due to low imine reactivity and competitive $\alpha$ deprotonation of imines that can form metalated enamines. ${ }^{30}$ However, activated imines such as $N$-acylimines, $N$-sulfonylimines, $N$-phosphonylimines and $N$-sulfinylimines react quickly.

As a result of the high reactivity of $N$-acylimines, they are often unstable and cannot be isolated. ${ }^{19}$ This has led to the development of many procedures for their in situ preparation. ${ }^{18}$ A
nice example has been demonstrated by Petrini, which utilizes both the nucleophilic and basic characteristics of organolithium and organomagnesium reagents for the in situ preparation and tandem nucleophilic addition to a variety of alkyl and aryl aldehyde based $\alpha$-amidosubstituted sulfones 92 (Scheme 10). ${ }^{30}$

Scheme 10. Organometallic additions to in situ prepared $N$-acylimines. ${ }^{30}$

Along similar lines, methodology for the in situ preparation of alkyl and aryl aldehyde based $N$-sulfonylimines followed by the addition of organolithium or Grignard reagents has also been developed. Weinreb demonstrated a nice example through the use of the Kresze reaction (Scheme 11). ${ }^{31}$ Aldehydes 95 were reacted with $N$-sulfinyl p-toluenesulfonamide $\mathbf{9 6}$ to generate the corresponding $N$-tosylimines 97 in situ, which were then reacted with a variety of alkyl, vinyl, allyl and alkynyl organolithium or Grignard reagents. ${ }^{31}$

Scheme 11. Organometallic additions to in situ prepared $N$-sulfonylimines. ${ }^{31}$

Zwierazk demonstrated that $\alpha$-arylalkylamines could also be generated by the addition of alkyl, vinyl, allyl and aryl Grignard reagents to $N$-(diethoxyphosphoryl)aldimines 99 (Scheme 12). ${ }^{23}$ The deprotected $\alpha$-arylalkylamines 101 were generated in moderate to good yields over the two step addition/deprotection sequence. ${ }^{23}$

Scheme 12. Addition of organometallics to N-phosphinoylimines. ${ }^{23}$

As a result of the high reactivity of organolithium and organomagnesium reagents, asymmetric addition reactions have generally been performed using stoichiometric amounts of chiral ligands or chiral auxiliaries attached directly to the imine or to the organometallic reagent. ${ }^{18,19}$ An interesting example of the use of a stoichiometric amount of ligand has been demonstrated by Toru. Grignard reagents were found to asymmetrically add to N -(2pyridylsulfonyl) aldimines 102 in the presence of a chiral phenyl-bis(oxazoline) ligand (Scheme
13). ${ }^{32}$ The asymmetric induction for these reactions is rationalized by invoking a ligand-bound tetrahedral Mg (II) complex 103, where the metal chelates with the oxygen atom and the nitrogen atom of the 2-pyridylsulfonyl protecting group. ${ }^{32,33}$

Scheme 13. Asymmetric addition of MeMgBr to N -(2-pyridylsulfonyl)aldimines. ${ }^{32}$

Ellman demonstrated that both aliphatic and aromatic $N$-tert-butanesulfinyl aldimines 105 reacted with Grignard reagents in non-coordinating solvents to produce the corresponding N -tert-butanesufinamides 107 in good yields and with excellent diastereoselectivities (Scheme 14). ${ }^{34}$ Since the diastereoselectivities for these reactions decreased in the presence of coordinating solvents, a cyclic six membered transition state 106 was proposed. ${ }^{34}$

Scheme 14. Addition of Grignard reagents to $N$-tert-butylsulfinyl imines. ${ }^{34}$

Moreau demonstrated that aromatic $N$-p-toluenesulfinyl aldimines reacted with BnMgCl in toluene at $-30^{\circ} \mathrm{C}$ to give the corresponding $N$ - $p$-toluenesulfinamides in moderate yields and diastereoselectivities. ${ }^{35}$ However, reactions performed under the same conditions with MeMgBr and $\mathbf{1 0 8}$ resulted in the formation of the sulfur addition products $\mathbf{1 0 9}$ and $\mathbf{1 1 0}$ (Scheme 15). ${ }^{35}$ In light of Moreau's findings, Chan demonstrated that the addition of a stoichiometric amount of CuI to the reaction mixture containing two equivalents of MeMgBr and $\mathbf{1 0 8}$ at $-15^{\circ} \mathrm{C}$ helped to suppress the formation of the sulfur adduct 109 . This reaction gave the desired $N-p$ toluenesulfinamide product in $49 \%$ yield and the sulfoxide 109 in only $21 \%$ yield. ${ }^{36}$

Scheme 15. Addition of MeMgBr to the $N$ - $p$-toluenesulfinyl aldimine 108. ${ }^{35}$

### 2.1.2.2 Dialkylzinc reagents

The lower nucleophilicity of dialkylzinc reagents has hindered their direct addition to less activated imines such as $N$-alkyl and $N$-arylimines, as well as $N$-phosphinolyimines. This was demonstrated in a paper by Qian who studied the effects of diethylzinc coordination in reactions with $N$-tosylimines. ${ }^{37}$ Qian reported that neither ( $E$ )-N-benzylidene- $P, P$-diphenylphosphinic amide nor ( $E$ )-N-benzylideneaniline reacted with $\mathrm{Et}_{2} \mathrm{Zn}$ after 24 h in toluene at room temperature. ${ }^{37}$ However, after 1 h in toluene, ( $E$ )- $N$-benzylidenebenzenesulfonamide 111 was shown to react with $\mathrm{Et}_{2} \mathrm{Zn}$ to give the reduction product 113 (Scheme 16). ${ }^{37}$ The product was proposed to arise from transfer of a $\beta$-hydrogen atom from one of the ethyl groups on zinc to the
carbon terminus of the imine $\mathrm{C}=\mathrm{N}$ bond via the cyclic six-membered transition state $\mathbf{1 1 2}$ shown in Scheme 16. ${ }^{37}$ This transition state is supported by a solvent study which showed that when coordinating solvents such as THF are used, the ethyl adduct becomes the predominant product for the reaction. ${ }^{37}$

Scheme 16. Reduction of N -tosylimines with $\mathrm{Et}_{2} \mathrm{Zn} .{ }^{37}$

Carretero demonstrated that $N$-(2-pyridinesulfonyl)aldimines 102 react with alkyl zinc bromides under copper catalyzed conditions to give the corresponding N -(2pyridinesulfonyl)amides in good to excellent yields. ${ }^{38}$ Primary and secondary alkyl zinc bromides containing alkene, ether, acetal, chloride, ester and nitrile groups were found to add efficiently to $102 .{ }^{38}$ The reactivity of $N$-(2-pyridinesulfonyl)aldimine was explained to arise from coordination of the imino and pyridyl nitrogen atoms to the copper catalyst, forming a fivemembered chelate ring. ${ }^{38}$ This metal coordination was used to explain the enhanced reactivity of $N$-(2-pyridinesulfonyl)aldimines over that of $N$-(heteroarylsulfonyl)imines which do not have the ability to form a bidentate chelate and were found not react under copper catalyzed conditions with organo zinc bromide reagents. ${ }^{38}$

As a result of the low nucleophilicity of dialkylzinc reagents, many asymmetric addition reactions have been reported which utilize Lewis basic chiral ligands to activate the zinc
reagent for addition to the imine. For example, Andersson discovered that the use of a stoichiometric amount of the ((1S,3R,4R)-2-methyl-2-azabicyclo[2.2.1]heptan-3-yl)methanol ligand effectively activated $\mathrm{Et}_{2} \mathrm{Zn}$ for the asymmetric addition to $(E)$ - $N$-benzylidene- $P, P$ diphenylphosphinic amide 114 (Scheme 17). ${ }^{39}$ The proposed transition state 115 for this reaction is shown in Scheme 17. ${ }^{39}$

Scheme 17. Ligand-activated asymmetric addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to $N$-phosphinoyl imine 114 . ${ }^{39}$

Charette has found that dialkylzinc reagents can be asymmetrically added to both alkyl and aryl N -phosphinoylaldimines, generated in situ, using a catalytic amount of $\mathrm{Cu}(\mathrm{OTf})_{2}$ and the chiral BozPHOS ligand (119, Scheme 18). ${ }^{40,41}$

Scheme 18. Copper-catalyzed asymmetric addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to $N$-phosphinoyl aldimines. ${ }^{41}$

### 2.1.2.3 Hydrozirconation and transmetallation

Hydrozirconation of alkenes and alkynes by the use of Schwartz's reagent $\left(\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}, \mathbf{1 2 0}\right)$ is a well established way to prepare alkyl and alkenylzirconocenes. ${ }^{42}$ While these species are nucleophilic, the steric shielding of the cyclopentadienyl ligands on zirconium often prevents nucleophilic addition of the alkyl or alkenyl group to bulky elecrophiles. ${ }^{42}$ As a result, transmetallation of these groups from zirconium to other metal centers such as zinc, rhodium and aluminum has led to the generation of a variety of organometallic nucleophiles capable of addition to electrophiles such as imines. Organometallic reagents generated from transmetallation of organozirconocenes have been effectively added to N -acyl, N -sulfonyl, N phosphinoyl and $N$-sulfinylimines.

In 2002, Wipf reported that the organometallic reagents derived from hydrozirconation of alkynes followed by transmetallation with $\mathrm{Me}_{2} \mathrm{Zn}$ effectively added to N sulfonyl and $N$-phosphinoylaldimines. ${ }^{43}$ Scheme 19 illustrates the hydrozirconation of 1-hexyne 121 with Schwartz's reagent 120 to generate the alkenylzirconocene species 122. The alkenyl substituent is then transmetallated from 122 with $\mathrm{Me}_{2} \mathrm{Zn}$ to form the vinylzinc reagent 123, which can then be added to the $N$-phosphionylimine 114 to form the final allylic $N$ -
phosphinoylamide 124. This work showed that a range of vinylzinc reagents could be prepared in situ from symmetrical internal alkynes and terminal alkynes containing silyl ether, silyl ester, sulfonamide and carbamate functionality. ${ }^{43}$ These zinc reagents were found to add in good overall yields (35-90\%) to both aryl $N$-phosphinoylaldimines and alkyl and aryl N sulfonylaldimines if the addition reactions were conducted in toluene. ${ }^{43}$

Scheme 19. In situ preparation of vinylzinc reagents and addition to aldimines. ${ }^{43}$

If the aldimine 114 was added to the vinylzinc reagent 123 in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, then the predominant product of the reaction was the $C$-cyclopropylalkylamide $128 .{ }^{43}$ This product was proposed to arise from the reaction pathway shown in scheme 20 . The reaction was found to be general for a number of aldimines, preferentially producing the anti diastereoisomer of the $C$ cyclopropylalkylamide products in good overall yields (45-91\%). ${ }^{43}$

Scheme 20. Reaction pathway for the synthesis of C-cyclopropylalkylamides. ${ }^{43}$

It was later reported by Hanzawa that $[\mathrm{RhCl}(\operatorname{cod})]_{2} 132$ could catalyze the addition of alkenylzirconocene chlorides $\mathbf{1 3 0}$ to both aryl and alkyl $N$-sulfonylaldimines (131, Scheme 21). ${ }^{44}$ The proposed catalytic cycle for these reactions is shown in Scheme $22 .{ }^{44}$

Scheme 21. Rhodium catalyzed addition of alkenylzirconocenes to aldimines. ${ }^{44}$

Scheme 22. Proposed catalytic cycle for the rhodium-catalyzed addition of alkenylzirconocenes to aldimines. ${ }^{44}$

The catalytic enantioselective addition of alkenylzirconocenes through zirconocene-zinc transmetallation has been well-established for the synthesis of chiral allylic alcohols resulting from addition into aldehydes. ${ }^{45}$ However, similar methodology for the synthesis of chiral allylic amines is still lacking. An interesting discovery was made in the Wipf group, demonstrating that alkenylzirconocenes, prepared via hydrozirconation of alkynes with $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}$, could be transmetallated to alane $\mathbf{1 3 5}$ and added to $N$-tert-butanesulfinylaldimines $\mathbf{1 3 6}$ (Scheme 23). ${ }^{46}$ A four-membered chelate transition state 137 was proposed to explain the stereochemistry of the resulting products. ${ }^{46}$

Scheme 23. Addition of vinylalanes to $N$-tert-butanesulfinylaldimines. ${ }^{46}$

### 2.1.3 Introduction to Bts and Ths sulfonyl protecting groups

In 1996, Vedejs introduced benzothiazole-2-sulfonyl chloride (139, BtsCl) and 5-methyl-1,3,4-thiadiazole-2-sulfonyl chloride (140, ThsCl) as efficient nitrogen atom protecting reagents for use in peptide coupling reactions. ${ }^{47}$ He reported that these protecting groups could be removed from amino acids in high yields without racemization under a variety of conditions, including treatment with Zn and acetic acid in ethanol, Al and $\mathrm{HgCl}_{2}$ in water and THF, and $\mathrm{H}_{3} \mathrm{PO}_{2}$ in THF at reflux (Scheme 24). ${ }^{47}$ The electron-withdrawing effects of the heteroaromatic group on the sulfone activate it for reduction with a variety of reagents, including $\mathrm{SmI}_{2}, \mathrm{Mg}(0)$ and thiolate nucleophiles. ${ }^{24,32,48}$ Many of these deprotection conditions are much more mild than those traditionally used for the cleavage of more electron rich sulfones.

Scheme 24. Protection and deprotection conditions for the Ths and Bts groups. ${ }^{47}$

### 2.2 RESULTS AND DISCUSSION

We sought to explore the reactivity of $N$-Bts- and $N$-Ths-benzaldimines with a variety of organometallic carbon-based nucleophiles. This section will discuss the synthesis of these aldimines and their reactivity towards a number of organometallic reagents including lithium-, magnesium-, zinc-, aluminum-, rhodium- and copper-based nucleophiles.

### 2.2.1 Synthesis of $\boldsymbol{N}$-Bts- and $\boldsymbol{N}$-Ths-benzaldimines

$N$-Bts- and $N$-Ths-benzaldimines were synthesized according to the route shown in Scheme 25. Initially, benzo[d]thiazole-2-thiol 142 and 5-methyl-1,3,4-thiadiazole-2-thiol 143 were converted to their corresponding sulfonyl chlorides $\mathbf{1 3 9}$ and $\mathbf{1 4 0}$ by oxidative chlorination with $\mathrm{Cl}_{2}(\mathrm{~g})$ in $33 \%$ aqueous acetic acid according to the procedure described by Vedejs. ${ }^{47}$ While the yields for these products varied considerably, the average yields were $45 \%$ for $\mathrm{Bts}-\mathrm{Cl}$ and 52\% for $\mathrm{Ths}-\mathrm{Cl}$.

The sulfonyl chlorides 139 and 140 were further reacted with liquid $\mathrm{NH}_{3}$ to form the sulfonamides 144 and 145 in $73 \%$ and $68 \%$ yield.

Scheme 25. Synthesis of $N$-Bts- and $N$-Ths-benzaldimines.

Initial attempts to synthesize $N$-Ths-benzaldimine 147 by $\mathrm{TiCl}_{4}$ mediated condensation of benzaldehyde 110 with 5-methyl-1,3,4-thiadiazole-2-sulfonamide 145 resulted only in recovery of the starting materials. The failure of this reaction was attributed to rapid hydrolysis of the highly activated $N$-Ths-benzaldimine product. Further attempts to synthesize the $\alpha$ amidosubstituted sulfone precursor by Petrini's methodology again resulted in unreacted starting material. It was found, however, that stock solutions of $N$-Ths-benzaldimine 147 could be prepared reproducibly by the reaction of $\mathbf{1 4 5}$ with one equivalent of benzaldehyde $\mathbf{1 1 0}$ in toluene under Dean-Stark conditions in the presence of $5.0 \mathrm{~mol} \%$ of PTSA. These stock solutions were prepared in 0.16 M concentration by filtering reaction mixtures into a dry volumetric flask and diluting them with toluene or THF. The yields for these reactions were determined by ${ }^{1} \mathrm{H}$-NMR integration using 1,2-dimethoxybenzaldehyde as the internal standard. It was found that the average yield for these reactions was $79 \%$ based on 12 individually prepared solutions with a
range of $76-82 \%$. All attempts to isolate the $N$-Ths-benzaldimine 147 from the reaction mixture led to rapid decomposition. The $N$-Bts-benzaldimine 146 was synthesized from benzo[d]thiazole-2-sulfonamide 144 and benzaldehyde $\mathbf{1 1 0}$ under the same reaction conditions as 147; however, Bts-benzaldimine 146 was found to be isolable as a stable crystalline solid. The average yield for the synthesis of $\mathbf{1 4 6}$ was $82 \%$ over 6 reactions within a range of $80-87 \%$.

### 2.2.2 Addition of organometallic reagents to the $N$-Bts- and $N$-Ths-benzaldimines

### 2.2.2.1 Lithium reagents

The addition of organolithium reagents to both $N$-Bts- and $N$-Ths-benzaldimines resulted in either poor yields or multiple decomposition products. As shown in Table 2, only the addition of MeLi to the $N$-Ths-benzaldimine 147 resulted in the formation of the desired product 148 in $23 \%$ yield. The addition of $t$-BuLi to the $N$-Ths-benzaldimine and MeLi to the $N$-Bts-benzaldimine resulted in multiple decomposition products by TLC analysis with no evidence of the desired product.

Table 2. Addition of Organolithium Reagents to 146 and 147.

| Entry | Ar | R | Product | Yield (\%) |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Ths (147) | Me | $\mathbf{1 4 8}$ | 23 |
| 2 | Ths (147) | $t$-Bu | $\mathbf{1 4 9}$ | $0^{\mathrm{a}}$ |
| 3 | Bts (146) | Me | $\mathbf{1 5 0}$ | $0^{\mathrm{a}}$ |

${ }^{a}$ Multiple decomposition products with no evidence of desired product by TLC analysis.

### 2.2.2.2 Grignard reagents

In contrast to the results obtained for the addition of organolithium reagents, Grignard reagents were found to be suitable nucleophiles for addition to both $N$-Ths- and $N$-Bts-benzaldimines. For the addition of $i-\operatorname{PrMgX}$ to 147 , neither the coordinating ability of the solvent nor the nature of the halogen on the Grignard reagent had an appreciable effect on the yield of the product (Table 3, entries 1, 2 and 4). However, it was found that the reaction temperature was important and must be kept at $-78{ }^{\circ} \mathrm{C}$ for the duration of the reaction (Table 3, entry 3). Under optimized reaction conditions, methyl, vinyl, 1-propynyl and phenyl magnesium bromide were reacted with 147 in THF at $-78{ }^{\circ} \mathrm{C}$ to afford the corresponding sulfonamide products in moderate yields (4661\%) after recrystallization.

Table 3. Addition of Grignard Reagents to $N$-Ths-Benzaldimine 147.

|  | Optimization Reactions |  |  |  | Yield (\%) ${ }^{\text {a }}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Solvent | X | R (product) | Temp. $\left({ }^{\circ} \mathrm{C}\right)$ | 2 Step $^{\text {b }}$ | 1 Step |

| 8 | 5:1 THF: <br> Toluene | Br | Ph (154) | -78 | 51 | $64^{\text {d }}$ |
| ${ }^{\text {a }}$ Yields based on recrystallized product; ${ }^{\text {b }}$ Yield over two steps based on mmol of 5 -methyl-1,3,4-thiadiazole-2-sulfonamide; ${ }^{\text {c }}$ Yield based on average yield for aldimine stock solutions (79\%); ${ }^{\text {d }}$ Yield based on the yield of aldimine 147 determined by ${ }^{1} \mathrm{H}$-NMR integration for the stock solution used. |  |  |  |  |  |  |

Grignard reagents were found to add more effectively to the $N$-Bts-benzaldimine 146. As shown in Table 4, MeMgBr , $i-\mathrm{PrMgCl}$, vinylMgBr, 1-propynyl MgBr and PhMgBr were reacted with $\mathbf{1 4 6}$ in THF at $-78{ }^{\circ} \mathrm{C}$ to afford the corresponding sulfonamide products in good yields (7187\%).

Table 4. Addition of Grignard Reagents to $N$-Bts-Benzaldimine 146.

### 2.2.2.3 Diethylzinc reactions

The addition of diethylzinc to both the $N$-Ths-benzaldimine and the $N$-Bts-benzaldimine succeeded with some surprising results. It was found that the addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to the N - Ths benzaldimine 147 proceeded best in non-coordinating solvents, such as toluene, when 2.5 equivalents of $\mathrm{Et}_{2} \mathrm{Zn}$ were added at room temperature (Table 5, entries 1, 2 and 3). Interestingly, it was also found that $\mathrm{Et}_{2} \mathrm{Zn}$ added to the N -Ths-benzaldimine 147 at $-78{ }^{\circ} \mathrm{C}$ in moderate yield over extended reaction times (Table 5, entry 4). A similar effect in the coordinating ability of the solvent was found for the addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to the N -Bts-benzaldimine $\mathbf{1 4 6}$ (Table 5, entries 5 and 6).

Table 5. Addition of Diethylzinc Reagents to 146 and 147.

| Entry | Ar (Product) | Solvent | Temp. $\left({ }^{\circ} \mathrm{C}\right)$ | $\mathrm{Et}_{2} \mathrm{Zn}$ <br> (equiv.) | Time (h) | Yield (\%) $^{\mathrm{a}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Ths (160) | THF | 25 | 1.2 | 4 | 43 |
| 2 | Ths (160) | Toluene | 25 | 1.2 | 2.5 | 53 |
| 3 | Ths (160) | Toluene | 25 | 2 | 2.5 | 70 |
| 4 | Ths (160) | Toluene | $-78{ }^{\circ} \mathrm{C}$ | 1.2 | 33 | 61 |
| 5 | Bts (161) | THF | 25 | 2 | 4 | 40 |
| 6 | Bts (161) | Toluene | 25 | 2 | 4 | 58 |

${ }^{a}$ Yields after recrystallization.

These results are different from what was reported by Qian for the reaction of (E)-Nbenzylidenebenzenesulfonamide $\mathbf{1 1 1}$ with $\mathrm{Et}_{2} \mathrm{Zn}$, which primarily gave the reduced product $\mathbf{1 1 3}$ in non-coordinating solvents. This interesting difference is most likely due to the higher reactivity of the $N$-Bts- and $N$-Ths-benzaldimines resulting from the greater electronwithdrawing effect of the heterocyclic sulfonyl activating groups.

### 2.2.2.4 Hydrozirconation - transmetallation reactions

The alkenylzinc reagents derived from hydrozirconation of 1-hexyne and 3-hexyne with $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(120)$ followed by in situ transmetallation to zinc, were added in moderate to good yields to both $N$-Bts- and $N$-Ths-benzaldimines (Table 6). Even though these reactions were conducted in the presence of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, the corresponding $C$-cyclopropylalkylamides were not detected. The methyl addition product was, however, isolated in $13 \%$ yield from the reaction of $N$-Bts-benzaldimine 146 with 1-hexyne derived alkenylzinc reagent (Table 6, entry 3).

Table 6. Addition of Alkenylzinc Reagents to 146 and 147.

| Entry | Alkyne | Ar <br> (product) | Solvent | Temp. $\left({ }^{\circ} \mathrm{C}\right)$ | Time (h) | Yield (\%) ${ }^{\mathrm{a}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1-hexyne | Ths (163) | $1: 1$ Toluene: <br> $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | 25 | 2.5 | 35 |
| 2 | 1-hexyne | Ths (163) | $1: 1 \mathrm{Toluene}^{\mathrm{CH}_{2} \mathrm{Cl}_{2}}$ | -40 | 10 | 57 |
| 3 | 1-hexyne | Bts (164) | $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | 25 | 4.5 | $71^{\mathrm{b}}$ |
| 4 | 3-hexyne | Ths (165) | $1: 1$ Toluene : $^{\mathrm{CH}_{2} \mathrm{Cl}_{2}}$ | 25 | 2 | 47 |

${ }^{\mathrm{a}}$ Isolated yields; ${ }^{\mathrm{b}} 13 \%$ of the methyl addition product was also isolated in this reaction.

Multiple attempts were made to effect an asymmetric addition of either diethylzinc or the alkenylzinc reagent derived from hydrozirconation of 1-hexyne to $N$-Bts- and $N$-Thsbenzaldimines. However, after screening a wide range of Lewis basic chiral ligands and exploring the asymmetric copper-catalyzed systems popularized by Charette, the enantiomeric excesses for these reactions were never $>12 \%$. This result is presumably due to high levels of competitive background reactions for the addition of the zinc reagents to the $N$-Bts- and $N$-Thsbenzaldimines. In the absence of chiral ligands, addition to aldimines proceeds in moderate yields at low temperatures over extended reaction times (Table 5, entry 4 and Table 6, entry 2).

The addition of the vinylalane, resulting from the hydrozirconation of 1-hexyne followed by transmetallation to aluminum with $\mathrm{Me}_{3} \mathrm{Al}$, to the $N$-Bts-benzaldimine was also briefly explored. As shown in Scheme 26, this reaction was found to be sluggish in toluene at room temperature, affording the product 164 in only $16 \%$ yield after 20 h .

1. $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$
$\xrightarrow[\text { 3. 146, Toluene, } \mathrm{rt}, 20 \mathrm{~h}]{\text { 2. } \mathrm{Me}_{3} \mathrm{Al}, 0^{\circ} \mathrm{C} \rightarrow \mathrm{rt}, 1 \mathrm{~h}}$

164: 16\% Yield

Scheme 26. Vinylalane addition to the $N$-Bts-benzaldimine 146.

In light of the work reported by Hanzawa, we decided to investigate asymmetric rhodium(I) catalyzed addition reactions of alkenylzirconocenes to the $N$-Bts-benzaldimine 146 using the commercially available $R, R$-MeDUPHOS ligand 167 and chiral diene 168 (Table 7). As shown in Table 7, the rhodium-catalyzed addition of the 1-hexyne derived alkenylzirconocene succeeded with moderate enantiomeric excess in dioxane with both the chiral ligand 167 and the chiral diene 168 (Table 7, entry 3 versus entries 1 and 2). Unfortunately, the catalytic turnover for these reactions remained low, with yields of 164 never increasing above 19\%.

Table 7. Asymmetric Rh(I) Catalyzed Addition Reactions to 146.

| Entry | Catalyst (mol\%) | Ligand <br> $(\mathrm{mol} \%)$ | Diene <br> $(\mathrm{mol} \%)$ | Solvent | Time <br> $(\mathrm{h})$ | Yield <br> $(\%)^{\mathrm{a}}$ | ee <br> $(\%)^{\mathrm{b}}$ |

[^1]Along with rhodium(I)-catalyzed additions of alkenylzirconocenes to the $N$-Btsbenzaldimine, we also explored the use of the $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{BF}_{4}$ catalyst 169 for these addition reactions. An interesting result was found with a protocol for the in situ preparation of $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}$ by the reaction of $\mathrm{Cp}_{2} \mathrm{ZrCl}_{2}$ with DIBAL-H as recently reported by Negishi. ${ }^{49}$ We found that the $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{BF}_{4}$ catalyst did not effectively catalyze the addition of the 1 hexenylzirconocene to $N$-Bts-benzaldimine 146 at room temperature in THF after 48 h (Table 8, entry 1). However, upon an attempt to activate the $N$-Bts-benzaldimine 146 with $\mathrm{BF}_{3} \bullet \mathrm{OEt}_{2}$, we discovered that the $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{BF}_{4}$ catalyst catalyzed the addition of the iso-butyl group from $i$ $\mathrm{Bu}_{2} \mathrm{AlCl}$ to generate the product $\mathbf{1 7 0}$ in $63 \%$ yield (Table 8, entry 2). In the absence of the copper(I) catalyst, no reaction occurred (Table 8, entry 3).

### 2.2.3 Deprotection of $\boldsymbol{N}$-Ths and $\boldsymbol{N}$-Bts-sulfonamides

After exploring the addition of organometallic nucleophiles to the $N$-Ths and $N$-Btsbenzaldimines, several deprotection reactions were investigated for the removal of the heteroaromatic sulfonyl groups from the sulfonamide products. Utilizing the procedure reported by Vedejs, it was found after some optimization that the slow addition of a $50 \% \mathrm{H}_{3} \mathrm{PO}_{2}$ solution to a mixture of either sulfonamides 148, 154 or 153 in refluxing THF efficiently produced the corresponding amines. These amines were isolated crude and then converted to their more stable Boc-protected derivatives 171, 172 and 173 in good yields over the two step reaction sequence (Table 9).

Table 9. $\mathrm{H}_{3} \mathrm{PO}_{2}$ Deprotection and Boc Protection of Crude Amines.

${ }^{\text {a }}$ Isolated yields over two steps.

The use of $\mathrm{SmI}_{2}$ was also investigated for the deprotection of the $N$-Bts- and $N$-Thssulfonamides 148 and 155 (Table 10). These reactions proceeded efficiently at room temperature after in the presence of excess $\mathrm{SmI}_{2}$ to generate the corresponding 1phenylethanamines. These amines were again isolated crude and then converted to their more stable Boc-protected derivatives 171 in good yields over the two-step reaction sequence.

[^2]
### 2.2.4 Addition of organometallic reagents to heterocyclic benzothiazole- and pyridyl-2sulfinylbenzaldimines.

As a result of the low enantiomeric excess obtained for the asymmetric addition reactions of organometallic reagents to $N$-Bts- and $N$-Ths-benzaldimines, we decided to explore the novel benzo[d]thiazole-2-sulfinyl (Bt-2-sulfinyl) and pyridyl-2-sufinyl (Py-2-sulfinyl) protecting groups as chiral auxiliaries for the diastereomeric addition of organometallic reagents to the respective heterocyclic sulfinylbenzaldimines. Racemic benzothiazole- and pyridyl-2sulfinylbenzaldimines were synthesized as shown in Scheme 27. Initially, benzo[d]thiazole-2thiol $\mathbf{1 4 2}$ or pyridine-2-thiol 174 was reacted with NBS in $\mathrm{EtOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature to produce the corresponding sulfinates 175 and 176 in $77 \%$ and $83 \%$ yield, respectively. ${ }^{50}$ These sulfinates were then reacted with LiHMDS at $-78{ }^{\circ} \mathrm{C}$ in THF to generate the corresponding sulfinamides 177 and 178 in $57 \%$ and $20 \%$ yields after aqueous workup. ${ }^{51}$ Sulfinamides 177 and $\mathbf{1 7 8}$ were then condensed with benzaldehyde $\mathbf{1 1 0}$ in the presence of $\mathrm{Ti}(\mathrm{OEt})_{4}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature to form the desired heterocyclic-2-sulfinylbenzaldimines $\mathbf{1 7 9}$ and $\mathbf{1 8 0}$ in $79 \%$ and 89\% yields.

Scheme 27. Synthesis of heterocyclic-2-sulfinylbenzaldimines 179 and 180.

The addition of organometallic reagents to benzothiazole-2-sulfinylbenzaldimine 179 was met with difficulty. The addition of MeMgBr to $\mathbf{1 7 9}$ gave results similar to those reported by Moreau for the reaction of $N$-p-toluenesulfinyl aldimines, with methylation taking place predominately at the sulfur atom of the sulfoxide, resulting in only trace amounts of the desired methylated product 181 (Scheme 28). The addition of 1 equivalent of CuI to the reaction mixture according to Chan's protocol unfortunately did not enhance the chemoselectivity for methylation, again resulting in only trace amounts of $\mathbf{1 8 1}$. Imine $\mathbf{1 7 9}$ was also found to be unreactive toward dialkylzinc, vinylzinc and vinylaluminum reagents in DCM or toluene at room temperature over extended periods of time.

Scheme 28. Addition of MeMgBr to 179.

Similarly, pyridyl-2-sulfinylbenzaldimine 180 was found in general to be unreactive toward vinylzirconocenes under copper- or rhodium-catalyzed conditions, vinylzinc reagents and vinylalanes. However, aldimine $\mathbf{1 8 0}$ did show moderate reactivity toward diethylzinc, cyclohexylzinc bromide and 1-propynylzinc halides under copper-catalyzed conditions as shown in Table 11.

${ }^{\text {a }}$ Formed via transmetallation of 1-propynylmagnesium bromide with $\mathrm{ZnCl}_{2}, \mathrm{ZnBr}_{2}, \mathrm{ZnI}_{2} .{ }^{\mathrm{b}} 10 \mathrm{~mol} \%$. ${ }^{\mathrm{c}}$ Ratios determined by ${ }^{1} \mathrm{H}$ NMR integration. ${ }^{\mathrm{d}}$ As determined by TLC. ${ }^{\text {e }}$ Not Determined.

As can be seen from Table 11, the reaction of aldimine $\mathbf{1 8 0}$ with various organozinc reagents under copper-catalyzed conditions could be optimized to afford moderate yields of the desired amines over reaction times of approximately 1 d . Variations of both solvent and temperature showed that the diastereomeric ratio for the addition of diethyl zinc to $\mathbf{1 8 0}$ was
highest in polar, non-coordinating solvents at $0^{\circ} \mathrm{C}$. Interestingly, lowering the reaction temperature from room temperature to $0{ }^{\circ} \mathrm{C}$ had no observable influence on the diastereomeric ratio for the addition of cyclohexylzincbromide to $\mathbf{1 8 0}$. Comparing the addition reactions of 1 propynylzinc halides to $\mathbf{1 8 0}$, the highest diastereomeric ratios could be achieved from the $(\mathrm{MeCN})_{4} \mathrm{CuBF}_{4}$ catalyzed addition of 1-propynylzinc bromide to $\mathbf{1 8 0}$ at room temperature, affording a dr of 3.5:1. Overall, pyridyl-2-sulfinylbenzaldimines have been shown to be moderately reactive towards the copper-catalyzed addition of organozinc reagents over the narrow substrate scope explored. The ability of this interesting class of chiral auxiliaries to chelate metal centers bodes well for their utility in the synthesis of $\alpha$-branched amines.

### 2.3 CONCLUSION

N -Bts and N -Ths-benzaldimines were viable substrates for the addition of several organometallic reagents, including alkyl, vinyl, propynyl and aromatic organomagnesium reagents, dialkyl and alkenylzinc reagents, and alkylcuprates. The product sulfonamides were smoothly converted to the corresponding amines by reaction with either $\mathrm{SmI}_{2}$ or $\mathrm{H}_{3} \mathrm{PO}_{2}$. Further exploration into the use of the pyridyl-2-sulfinyl protecting group as a heterocyclic auxiliary for the synthesis of chiral amines from the corresponding imines has led to promising results for the addition of organozinc reagents under copper catalysis. This interesting class of heterocyclic sulfonyl- and sulfinyl-benzaldimines has displayed good and in some cases unique reactivities toward a variety of organometallic reagents. They are therefore potential alternatives to conventional protecting groups in the synthesis of $\alpha$-branched amines.

# 3.0 STRUCTURE ELUCIDATION AND SYNTHESIS OF A PUTATIVE POLO LIKE KINASE - POLO BOX DOMAIN (PLK1-PBD) INHIBITOR 

### 3.1 OVERVIEW

This chapter will present the discovery of a novel Plk1-PBD inhibitor resulting from a HTS effort conducted by the PMLSC. The synthetic and analytical procedures utilized to identify the correct chemical structure of the biologically active substance are discussed. The composition of the initially unknown substance and the decomposition pathways of this substance are characterized. Finally, the synthesis of a library of 56 analogues targeted to the discovery of the biologically active species (scaffold) in the initially tested HTS sample is reported.

### 3.2 INTRODUCTION

Polo-like kinases (Plks) are named after the discovery of the polo gene of Drosophila melanogaster. ${ }^{52,53}$ Mammalian Plks represent a unique family of four serine/threonine (S/T) kinases (Plk1-4) as they contain both an N-terminal kinase domain and a C-terminal polo-box domain (PBD); two structural features evolutionary conserved from yeast to mammals. ${ }^{54,55}$ Investigations into the roles of Plks 1-4 as regulatory enzymes during cell division have shown Plks are active during mitosis, meiosis and cytokinesis. ${ }^{55}$ Of the four mammalian Plks, the
biological functions of Plk1 are the best understood. Plk1 is expressed mainly during the late G2 and M phases of the cell cycle and is a key enzyme involved in regulation and progression of mitotic events including mitotic entry, centrosome maturation and separation, bipolar spindle formation, chromosome segregation and cytokinesis. ${ }^{56}$ Critical to the function of Plk1 is the PBD which serves as a (pSer/pThr) phosphopeptide binding domain that regulates the subcellular location of Plk1 during mitosis and stimulates the activity of the kinase domain through a conformational switching mechanism that releases the kinase domain from an inhibitory interaction with the PBD upon phosphopeptide binding. ${ }^{57,58}$ The PBD of Plk1 serves to localize Plk1 to mitotic structures including chromosomes, kinetochores and the spindle midzone during mitosis. ${ }^{59}$ In a study by Hanisch, overexpression of the PBD of Plk1 in HeLa S3 cells was shown to displace endogenous Plk1 from chromosomes and kinetochores resulting in spindle checkpoint-dependent mitotic arrest due to interference with proper chromosome congression. ${ }^{60}$

In adult tissues, Plk1 expression has been found to be highest in actively proliferating cell populations (spleen, ovary and testis) and very low in the liver, kidney, brain, thymus, intestine, lung, pancreas, heart, stomach and skin. ${ }^{61,62}$ The important function of Plk1 in maintaining genomic stability during cell division suggests that the levels of Plk1 must be tightly regulated during mitotic progression. It has been found that either overexpression or downregulation of Plk1 in vivo induced tumorigenesis in mice. ${ }^{61,63,64}$ Plk1 overexpression has been reported in many cancers, including: lung, pancreases, endometrium, brain, breast, ovary, colon, skin, head and neck, esophagus, gastric tract and prostate; and overexpression of Plk1 often correlates with tumor aggressiveness and poor patient prognoses. ${ }^{61,62,65} \mathrm{Plk} 1$ is a validated target for cancer therapies as several studies using RNA interference-based strategies have shown that
the depletion of Plk1 in different cancer cell lines led to cell death in vitro and tumor suppression in mice with human xenograft tumors. ${ }^{66-69}$ The development of drugs targeting Plk1 is inspired by an approach designed to target key enzymes active during mitosis as a way to inhibit the hyperproliferative state of tumor cells and induce apoptosis. ${ }^{70,71}$

Several small molecule inhibitors of Plk1 have been identified which generally target Plk1 in one of two ways: a) ATP-competitive inhibition at the kinase domain or b) inhibition at the PBD. Inhibition of Plk1 at the kinase domain has led to the identification of several potent and selective ATP-competitive inhibitors including BI 2536, BI 6727 and GSK 461364A, which are currently in clinical trials as chemotherapeutics for non-small-cell lung cancer, leukemia and solid cancer (Figure 7, top). ${ }^{62,72-76}$ Less well known are Plk1 small molecule inhibitors that target the PBD (Figure 7, bottom). Inhibitors of the PBD may have the advantage of being highly selective for Plks vs. other related protein kinases containing structurally similar catalytic domains. ${ }^{77}$ Furthermore, specific inhibition of Plk1-PBD among the other mammalian Plks represents an important challenge for the development of small molecule PBD based inhibitors, since all Plks are active with nonoverlapping functions during the cell cycle and in tumor progression. ${ }^{78}$ To date, three small molecule inhibitors of Plk1-PBD have been identified; purpurogallin $\mathrm{IC}_{50} \sim 0.3 \mu \mathrm{M}$, poloxin $\mathrm{IC}_{50} 4.8 \pm 1.3 \mu \mathrm{M}$ and thymoquinone $\mathrm{IC}_{50} 1.14 \pm 0.04$ $\mu \mathrm{M} .{ }^{79,80}$ Inhibition of Plk1-PBD by these small molecule inhibitors of the PBD showed the hallmarks of PBD overexpression found by Hanisch, resulting in Plk1 mislocation, chromosomal congression defects and mitotic arrest, suggesting that small molecule inhibitors of Plk1-PBD have the potential to become valuable anticancer drugs. ${ }^{79,80}$

Figure 7. Selected inhibitors of Plk1: ATP-competitive inhibitors currently in clinical trials (top) and PBD selective inhibitors (bottom).

### 3.2.1 Project Background

The potential for kinase selectivity coupled with the important roles of Plk1-PBD during mitosis peaked our interest in the identification of PBD based Plk1 inhibitors. An HTS campaign conducted by the PMLSC of 97,090 samples provided by the NIH SMR identified 11 hits ( $0.011 \%$ of the originally screened compounds) as concentration-dependent inhibitors of phosphopeptide binding to Plk1-PBD with an $\mathrm{IC}_{50}<50 \mu \mathrm{M}$ (Figure 8). ${ }^{81}$ A fluorescence polarization assay with recombinant Plk1-PBD was used to monitor for inhibition of Plk1. This assay was developed by the Yaffe group at MIT and was submitted to the MLSCN for this HTS campaign. ${ }^{82}$ Of the 11 hits, SID 861574 was found to be a $2.41 \pm 0.71 \mu \mathrm{M}$ inhibitor of Plk1PBD and was chosen for further chemical hit-to-probe development as it's structure could be readily modified. SID 861574 also did not have the undesirable electrophilic or hydrolytic structural features present in the remaining active compounds.

Several rounds of medicinal chemistry optimizations led to the generation of a novel library of 38 analogues, including a synthetic sample of SID 861574 (205, Scheme 29). However, all of these showed no affinity to Plk1-PBD in follow up assays. ${ }^{83}$ The lack of affinity to Plk1-PBD of the resynthesized hit (205) as well as its 38 analogues from the first round of medicinal chemistry led us to examine the nature of the original sample of SID 861574. Low resolution EI mass spectral data demonstrated a strong molecular ion of $m / z 319\left(\mathrm{M}^{+}, 57\right)$, consistent with the expected mass of SID 861574. The ${ }^{1} \mathrm{H}$ NMR spectra strongly supported the presence of an ethyl ester, a para-substituted aromatic ring system, and at least one heteroaromatic proton with a chemical shift similar to that found for a 6-amino or 6hydroxyuracil ring system. An ATR-IR spectrum of SID 861574 indicated the presence of a carboxylic acid functionality (peaks at 2863 (very broad) and $1644 \mathrm{~cm}^{-1}$ ).

Scheme 29. Synthesis of 205, the originally proposed compound/structure of SID 861574.

### 3.3 IDENTIFICATION OF THE STRUCTURE OF SID 861574

### 3.3.1 Initial synthetic attempts toward the identification of SID 861574

The results from the above spectral analyses of SID 861574 guided us in the preparation of a set of analogues that would be consistent with both the mass and the structural features of the original SID 861574 sample. We chose an approach in which the 6 -amino or 6-hydroxyuracil ring system remained intact and the positions of the para-substituted aromatic ring and the ethyl ester, amide or carboxylic acid groups were varied along the uracil core. This strategy led to the synthesis of five isomers of the original hit (Figure 9). The synthetic routes utilized to generate these isomeric analogues as well as the carboxylic acid derivative of 205 are shown in Schemes 30-34 and are summarized below.

206

207

208

209

210

Figure 9. Isomeric analogues of SID 861574.

### 3.3.1.1 Synthesis of the carboxylic acid analogue of 205

Compound 205 was converted to its carboxylic acid derivative by saponification with LiOH followed by acidification with HCl to produce 211 in 88\% yield (Scheme 30). This derivative was synthesized as an analogue of the originally proposed structure of the HTS hit for further biological testing against Plk1-PBD.

205

211 (88\%)

Scheme 30. Synthesis of carboxylic acid analogue 211.

### 3.3.1.2 Synthesis of the isomeric 6-aminouracils 206 and 207

Analogues 206 and 207 were synthesized according to the route shown in Scheme 31. Initially, four 5-substituted-6-methylthiouracil intermediates 216, 217, 218 and 219 were synthesized by the cyclization of malonates 212,213 or 214 , with 215 according to the literature. ${ }^{84}$ Direct aminolysis of these intermediates with 5 equivalents of either 4-aminobenzoic acid or ethyl 4aminobenzoate under microwave conditions ( $120-150{ }^{\circ} \mathrm{C}$ ) in DMF led to poor isolated yields of
the respective 6-aminouracils. It was found, however, that the m-CPBA oxidation of intermediates 216 and 217 followed by aminolysis of the corresponding sulfoxides at $95-100{ }^{\circ} \mathrm{C}$ in dioxane produced the 6-aminouracil intermediate 224 and analogue 206 in $76 \%$ and $50 \%$ yield, respectively. ${ }^{85}$ Compound 224 was converted to the final product, carboxylic acid 207, by palladium-catalyzed hydrogenolysis of the benzyl ester in 73\% yield.

Scheme 31. Synthesis of SID 861574 isomers 206 and 207.

### 3.3.1.3 Synthesis of 6-aminouracil analogues 208 and 209

Compound 208 was synthesized according to the route shown in Scheme 32. In light of further SAR analyses, the three 6-aminouracils 227, 228 and 229 were synthesized by aminolysis of 6chlorouracil (226) with either 4-aminobenzoic acid, 4-ethylaminobenzoate or 4benzylaminobenzoate in variable yields. Of these three 6-aminouracils, 228 was further converted to the corresponding carbamate 230 by reaction with diethyl pyrocarbonate in $18 \%$
yield. Intermediate 230 was converted in $36 \%$ yield to the isomeric carboxylic acid analogue 208 by hydrogenolysis of the benzyl ester using Pearlman's catalyst.

Scheme 32. Synthesis of isomeric analogue 208.

Analogue 209 was synthesized according to the route shown in Scheme 33. The requisite precursor, urea 231, was obtained in $79 \%$ yield by a reaction of 4 -aminobenzoate with potassium cyanate. The urea 231 was condensed with cyanoacetic acid under microwave conditions, producing 232, which was cyclized by heating at reflux in HMDS in the presence of $15 \%$ TMSCl to furnish the 6-aminouracil 233 in $77 \%$ yield. ${ }^{86,87}$ Saponification of the 6-aminouracil derivative with LiOH followed by acidification with HCl produced the corresponding acid $\mathbf{2 3 4}$ in 95\% yield. This carboxylic acid intermediate was protected as the benzyl ester 235 by deprotonation with $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ followed by reaction with benzyl bromide according to a literature
procedure. ${ }^{88}$ The benzyl protected 6 -aminouracil was then deprotonated with excess LiHMDS and reacted with ethyl chloroformate, generating a mixture of products from which the 6carboethoxyaminouracil derivative $\mathbf{2 3 6}$ was isolated crude in $20 \%$ yield. This intermediate was then converted to the final analogue 209 in moderate yield and in $\sim 87 \%$ purity based on ${ }^{1} \mathrm{H}$ NMR.

Scheme 33. Synthesis of isomeric analogue 209.

### 3.3.1.4 Synthesis of the 6-hydroxyuracil analogue 210

Analogue 210 was synthesized according to the route shown in Scheme 34. Initially, the urea 231 was cyclized with diethyl malonate in the presence of NaOEt in ethanol at reflux. ${ }^{89}$ The reaction mixture was acidified to a pH of $6-7$ with HCl , furnishing the sodium salt of the corresponding 6-hydroxyuracil 237 in 49\% yield. The isolated sodium salt was then either acidified to a pH of 1.5, generating the ethyl ester intermediate 238, or further saponified with

LiOH and subsequently treated with HCl to produce the carboxylic acid 239. The ethyl ester intermediate 238 was condensed with ethyl isocyanate, producing 240 , which was saponified with LiOH to reach the final analogue, 210, upon acidification with HCl in $46 \%$ yield. ${ }^{83}$

Scheme 34. Synthesis of isomeric 6-hydroxyuracil analogue 210.

### 3.3.1.5 Conclusions of the initial synthetic attempt to identify the structure of SID 861574

In this round of synthetic analoging, 25 new samples were synthesized including five analogues isomeric with the major component of the original HTS hit. Unfortunately, none of the five isomers prepared in this study were spectroscopically identical to SID 861574 by ${ }^{1} \mathrm{H}$ or ${ }^{13} \mathrm{C}$ NMR. Consequently, the identity of this substance remained unknown.

### 3.3.2 Structure elucidation of SID 861574: Development of a controlled synthesis of $N_{1}, N_{3}$-differentially-substituted 5-methylene-6-hydroxy uracils

A breakthrough regarding the identity and structural connectivity of SID $\mathbf{8 6 1 5 7 4}$ came about via isolation of an X-ray quality crystal after slow evaporation of a $1: 1$ solution of $\mathrm{MeOH}: \mathrm{ACN}$ at 5 ${ }^{\circ} \mathrm{C}$, revealing the structure 241 shown in Figure 10. This surprising result showed a structure for SID 861574 bearing the molecular formula $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{7}$ that contained an $N_{3}$-carbethoxy-substituted-6-hydroxy uracil core substituted in the $N_{1}$ position with a $p$-substituted benzoic acid moiety. In light of the differences between the X-ray structure and the originally proposed structure for SID 861574, evident by different atom connectivity's and molecular formulas/weights $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{6}\left(\mathrm{~m} / \mathrm{z} 319\left(\mathrm{M}^{+}\right)\right)$vs. $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{7}\left(\mathrm{~m} / \mathrm{z} 320\left(\mathrm{M}^{+}\right)\right)$, a ${ }^{1} \mathrm{H}$ NMR (300 MHz , DMSO- $\mathrm{d}_{6}$ ) was taken of a small set of the crystals sent for X-ray crystallography which showed no evidence of sample degradation/contamination. A second crystal from this set was also submitted for X-ray crystallographic analysis, giving an identical result to the first submission.

Figure 10. Originally obtained X-ray structure (241) for SID 861574.

Our initial synthetic approach to access the proposed structure of SID 861574 was through a cyclization strategy. Urea 243 would be cyclized with a highly reactive electrophile such as malonyl chloride or carbon suboxide $\left(\mathrm{C}_{3} \mathrm{O}_{2}\right)$ directly furnishing the appropriately $N_{1}, N_{3^{-}}$ subsituted-6-hydroxy uracil core. Subsequently, benzyl ester cleavage would unveil the requisite carboxylic acid (Scheme 35). Secondary urea 243 was synthesized by the initial conversion of amine 225 to the primary urea 242 by reaction with KOCN. Deprotonation of 242 with LiHMDS and subsequent reaction with Mander's reagent at $-78{ }^{\circ} \mathrm{C}$ generated $\mathbf{2 4 3}$ in $63 \%$ yield. ${ }^{90,91}$ Attempts to cyclize 243 by reaction with malonyl chloride in the presence of $\mathrm{Et}_{3} \mathrm{~N}$, DIPEA or NaH in DCM or THF at $0^{\circ} \mathrm{C}$ or room temperature resulted only in recovery of the starting urea. Similarly, the reaction of $\mathbf{2 4 3}$ with carbon suboxide in THF, $\mathrm{Et}_{2} \mathrm{O}$ or DCM at -78 or $0^{\circ} \mathrm{C}$ resulted in the isolation of $\mathbf{2 4 3}$ with no evidence of formation of $\mathbf{2 4 4} .^{92}$ It was found, however, that the primary urea 242 could be cyclized with malonyl chloride in the presence of Hünig's base to furnish the $N_{1}$-subsituted-6-oxo-uracil 245 in $39 \%$ yield. Further elaboration of 245 to carbamate 244 was met with difficulty, as the reaction of $\mathbf{2 4 5}$ with ethyl chloroformate in the presence of triethylamine resulted in a selective $O$-carbethoxylation reaction forming carbonate 246 in $64 \%$ isolated yield (Scheme 35). The carbonate 246 was found to be stable upon storage at $-5^{\circ} \mathrm{C}$ under nitrogen gas for months; however, $\mathbf{2 4 6}$ was found to decompose by ~50\% after approximately 20 h in $\mathrm{DMSO}-\mathrm{d}_{6}$ at room temperature. Similar acylation reactions are known for piperidine-3,5-dione which was reported to undergo $\mathrm{N}, \mathrm{O}$-dicarbethoxylation upon reaction with excess ethyl chloroformate in the presence of $\mathrm{Et}_{3} \mathrm{~N} .{ }^{93}$

Scheme 35. Attempted synthesis of carbamate 244. Synthesis of carbonate 246.

Further, reaction of $\mathbf{2 4 6}$ in THF with $20 \mathrm{~mol} \%$ of Pearlman's catalyst under a hydrogen gas atmosphere ( 1 atm ) successfully cleaved the benzyl ester and gave carboxylic acid 247 in 61\% yield. Efforts toward the conversion of carbonate 246 to carbamate 244 were investigated under thermodynamic reaction conditions by reacting 246 with $20 \mathrm{~mol} \%$ DMAP in THF at room temperature (Scheme 36). After 4 h , this reaction resulted in the conversion of 246 to a $4: 1$ mixture of 248:245 by ${ }^{1} \mathrm{H}$ NMR analysis, demonstrating an interesting $O$ - to $C$-carbethoxy transfer reaction catalyzed by DMAP and driven by the thermodynamic stability of the product ethyl ester 248. It was found that while the conversion for this reaction was respectable, compound 248 was difficult to purify from the $\sim 20 \%$ of $\mathbf{2 4 5}$ contaminating the final reaction mixture. Accordingly, an alternative cyclization reaction was developed in which $\mathbf{2 4 8}$ was prepared by the initial reaction of $\mathbf{2 4 2}$ with ethyl malonyl chloride generating intermediate $\mathbf{2 5 1}$
which was then cyclized over the $N_{1}-C_{5}$-uracil ring positions by reaction with CDI in the presence of triethylamine. This new cyclization strategy for uracil synthesis generated 248 in $66 \%$ isolated yield. The independently prepared products 248 from both routes were converted to their corresponding carboxylic acids 249 by hydrogenolysis of the benzyl esters. Product samples of 249 from both reaction pathways were combined and found to be identical by ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $\mathrm{d}_{6}$ ), offering further confirmation to the assigned structure of 248 isolated from the thermodynamic equilibration study. The spectral data for compounds 247 and 249 again proved these products to be distinct from the original HTS hit SID 861574.

Scheme 36. Synthesis of $O$ - and $C$-carbethoxylated derivatives 247 and 249.

The results above indicate that while $O$ - and $C$-carbethoxylation of $\mathbf{2 4 5}$ can be readily achieved, selective $N_{3}$-carbethoxylation is complicated by both the thermodynamic stability of
the $C_{5}$-carbethoxy substitution and the lack of nucleophilicity of the $N_{3}$-nitrogen of the 6-oxouracil scaffold. As a result, we sought to develop a protecting group strategy for the uracil $C_{5}{ }^{-}$ ring position. Initially, we attempted to implement this strategy by protecting the $C_{5}$-position of substrate 245 through a reaction with trimethylene dithiotosylate $\left(\mathrm{TsS}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{STs}\right.$, 254) to produce the corresponding dithiane 256 (see Scheme 37 for structure). ${ }^{94,95}$ Unfortunately, the reaction of 245 with trimethylene dithiotosylate using KOAc as a base in absolute ethanol at reflux or using triethylamine as a base in either ACN or DCM at room temperature led to complex reaction mixtures, affording only slight evidence of product formation by ${ }^{1} \mathrm{H}$ NMR analysis. ${ }^{96,97}$ The lack of efficiency for the formation of dithiane $\mathbf{2 5 6}$ from the cyclic precursor 245 led us to try a more stepwise approach to the formation of this compound (Scheme 37). In the first step, primary urea 242 was reacted with methyl malonyl chloride in THF at room temperature to afford $\mathbf{2 5 3}$ in $92 \%$ yield. After reaction optimization, it was found that $\mathbf{2 5 3}$ could be smoothly converted to 255 in $94 \%$ yield by reaction with trimethylene dithiotosylate in the presence of 2.5 equivalents of triethylamine in DCM at room temperature. Dithiane 255 was then cyclized by treatment with excess $\mathrm{K}_{2} \mathrm{CO}_{3}$ in ACN at reflux over 4 h to afford the desired $C_{5^{-}}$ protected-6-oxo-uracil intermediate 256 in 67\% yield.

Scheme 37. Synthesis of the $C_{5}$-protected-6-oxouracil intermediate 256.

Initial attempts to introduce the ethyl ester at the $N_{3}$-position of 256 by reaction with a large excess of both triethylamine and ethyl chloroformate in DCM surprisingly afforded the ethyl adduct 257 in $71 \%$ yield (Scheme 38). This interesting reagent combination allows for a relatively mild method for $N_{3}$-ethylation of $N_{1}$-substituted- $C_{5}$-disubstituted-6-oxo-uracil scaffolds. ${ }^{98,99}$ The scope and mechanism of this alkylation reaction has not been further investigated. It was found, however that 256 could be successfully $N_{3}$-carbethoxylated by reaction with ethyl chloroformate using pyridine as a base to form the carbamate $\mathbf{2 5 8}$ in $91 \%$ yield.

Scheme 38. Synthesis of $N_{3}$-ethyl / $N_{3}$-carbethoxy-6-oxouracils 257 and 258.

Utilizing 257 as a model substrate to optimize the reaction conditions for cleavage of the dithiane, it was found that common desulfurization conditions including reaction with activated Raney nickel under a hydrogen gas atmosphere (1 atm) or reaction with nickel or cobalt borohydride failed to produce the desired desulfurized product. ${ }^{100}$ Reductive cleavage of the dithiane was ultimately accomplished via a modification of a procedure reported by Holton which demonstrated the efficiency of activated zinc to reductively desulfurize $\alpha$-phenylthio ketones and esters under mild reaction conditions. ${ }^{101-103}$ Thus, the reaction of 257 in a 1:1 solution of aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ :THF with 10 equivalents of nano-zinc at room temperature followed
by an acidification of the reaction mixture to $\mathrm{pH} 1.0-1.5$ with a 1.0 M HCl solution furnished 259 in 62\% yield (Scheme 39). Gratifyingly, the application of this methodology to intermediate 258 smoothly cleaved the dithiane, forming carbamate 244 in $66 \%$ yield. Hydrogenolysis of the benzyl ester from 244 proceeded cleanly in $77 \%$ yield to the desired carboxylic acid $\mathbf{2 4 1}$. This reaction represents the first example of the use of a dithiane protecting group strategy to synthesize $C_{5}$-unsubstituted- $N_{1}, N_{3}$-differentially-substituted-6-oxo-uracil scaffolds and should be beneficial for the development of barbiturates containing this unique and synthetically challenging substitution pattern.

Scheme 39. Synthesis of the originally proposed X-ray structure 241.

To test the structural equivalency of $\mathbf{2 4 1}$ with the original HTS hit, a 1:1 mixture of $\mathbf{2 4 1}$ and SID 861574 was prepared in DMSO- $\mathrm{d}_{6}$ for ${ }^{1} \mathrm{H}$ NMR analysis. As can be clearly seen from the ${ }^{1} \mathrm{H}$ NMR spectrum shown in Figure 11, these two compounds were found not to be identical, allowing us to rule out the structure of $\mathbf{2 4 1}$ as that of SID 861574. In fact, in contrast to SID 861574, compound 241 was found to form exclusively the keto-tautomer in DMSO- $\mathrm{d}_{6}$, as evidenced by the methylene peak at $\delta 3.97$ ppm. While the structure of SID 861574 remained
elusive, this work allowed for the generation of a series of closely related SID 861574 analogues and ultimately illuminate the structure of SID 861574.
a) Original sample of SID 861574

Figure 11. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $\mathrm{d}_{6}$ ) stack plot of a) SID 861574 b) compound $\mathbf{2 4 1}$ and c) a $1: 1$ mixture of SID 861574 and 241.

The X-ray crystal structure of SID 861574 provided valuable information about the overall atom connectivity present in the molecular scaffold; however, the spectral inequivalency of SID 861574 and 241 suggested an inconsistency between one or more assignments in the crystal structure and the atoms present in SID 861574. A close comparison of the ${ }^{13} \mathrm{C}$ NMR data of SID 861574 and analogues 247, 249 and 241 provided important insight regarding the nature of the core heterocycle and the point of attachment of the ethyl ester (Figure 12). First, the $C_{2^{-}}{ }^{-}$
carbonyl functionality in the 6-hydroxy uracil ring of substrates $\mathbf{2 4 7}$, 249 and $\mathbf{2 4 1}$ consistently falls within the chemical shift range of $\delta 149.3$ - 150.0. The closest carbonyl resonance found for SID 861574 was well outside this range at $\delta 159.5$, suggesting that the core heterocycle was not a 6-hydroxy uracil. Second, as can be seen from ethyl carbonate 247 and ethyl carbamate 241, the chemical shift for the respective carbonyl resonances are found within a range of $\delta$ 148.9 - 150.4, signaling that the ethyl ester functionality of SID 861574 was not attached to a N or $O$-heteroatom but more likely to a $C$-atom as can be see by comparison with the ethyl ester analogue 249. These two points together supported a structure in which the ethyl ester was attached to a carbon atom on the core heterocycle, which appeared to be a 4,6-dihydroxy-2piperidone and not a 6-hydroxy uracil (Figure 12, compound 260). Further evidence for this observation came about via a re-refinement of the original X-ray crystallography data in which the $N_{3}$-6-hydroxy uracil nitrogen atom was replaced with a carbon atom; hence, producing the 4,6-dihydroxy-2-piperidone core of $\mathbf{2 6 0}$ and decreasing the R-value for the original data set from 0.0809 to 0.0750 . On the basis of this information, we sought to synthesize compound 260 and directly compare it to SID 861574.

### 3.3.3 Positive identification of the structure of SID 861574 and biological testing results against Plk1-PBD

The synthesis of 260 was based on a procedure reported by Mee which demonstrated that reaction of sodium diethyl 3-oxoglutarate with phenyl isocyanate in ether at reflux produced as the major product ethyl 2,4,6-trioxo-1-phenylpiperidine-3-carboxylate. ${ }^{104}$ Utilizing Mee’s protocol, it was found that reaction of sodium diethyl 3-oxoglutarate with benzyl 4isocyanatobenzoate 262 at $0^{\circ} \mathrm{C}$ followed by heating in ether produced the uncyclized adduct 263 as the major product (Scheme 40). ${ }^{105}$ Cyclization of $\mathbf{2 6 3}$ took place in the presence of NaH (2.0 equiv.) by heating in THF for 45 min to give $\mathbf{2 6 4}$ as the major product in $50 \%$ crude yield after acidification. These two reactions were then combined into one step by performing the reaction
in THF at reflux in the presence of NaH (2.5 equiv.) to furnish 264 in $39 \%$ yield and $90-95 \%$ purity by ${ }^{1} \mathrm{H}$ NMR (Scheme 40). While the original synthetic plan was to selectively cleave the benzyl ester of intermediate 264 through a palladium-catalyzed hydrogenolysis, exquisite chemoselectivity was found for the cleavage of the benzyl ester via saponification with 1.0 M NaOH , leading to the desired compound 260 in $78 \%$ yield. A simplified one-pot reaction was developed in which a mixture of diethyl 3-oxoglutarate and readily available ethyl 4isocyanatobenzoate 203 in THF were reacted in the presence of excess NaH at $0^{\circ} \mathrm{C}$ to cleanly generate in situ the ethyl ester analog of 263. Cyclization and saponification of this intermediate was accomplished by the addition of an equal volume of 1.0 M NaOH to THF with stirring at room temperature for 1 h . The resulting product was easily purified from this biphasic reaction mixture by removal of the THF layer and acidification of the aqueous layer with concentrated $\mathrm{HCl}(\mathrm{pH} 0.0-0.5)$ at $0^{\circ} \mathrm{C}$, which cleanly precipitated 260 in $87 \%$ yield.

Scheme 40. Optimization of a one-pot synthesis of 260 (SID 861574).

Upon isolation, a 1:1 solution of $\mathbf{2 6 0}$ and SID 861574 was prepared in DMSO- $\mathrm{d}_{6}$ for ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ) analysis. This NMR analysis demonstrated that 260 and SID 861574 were spectroscopically equivalent and hence identical compounds. Compound 260 and SID 861574 were also found to be identical by ${ }^{13} \mathrm{C}$ NMR, IR, MS and X-ray crystallography. A sample of the newly synthesized compound 260 was tested against Plk1-PBD. Interestingly, unlike the initial assay results of the original HTS screen which showed SID 861574 to inhibit Plk1-PBD with an $\mathrm{IC}_{50}$ of $2.41 \pm 0.71 \mu \mathrm{M}$, freshly prepared 260 was found to be inactive against Plk1-PBD (IC ${ }_{50}>$ $50 \mu \mathrm{M})$.

### 3.4 INVESTIGATIONS INTO THE SAMPLE COMPOSITION OF SID 861574

As of 3/3/10, samples of two lots of SID 861574 were obtained for analysis. The first lot, STOCK4S-15512 was the lot from which the originally tested sample of SID 861574, provided by the NIH SMR originated. The second lot PHAR065456 was obtained later and both batches are/were available from Ambinter. Samples from these lots were directly compared by ${ }^{1} \mathrm{H}$ NMR (300 MHz) analysis in DMSO- $\mathrm{d}_{6}$ and it was found that both lots were identical in composition (Figure 13a, 13b and 13c). Further NMR analysis of these two lots (now referred to collectively as SID 861574) showed the major contaminant of the sample to be $\mathrm{NH}_{4} \mathrm{Cl}$ (Figure 13d).

b) SID 861574: Lot \# 2 (PHAR065456)

c) SID 861574: 1:1 mixture of Lot \# 1 (STOCK4S-15512) to Lot \# 2 (PHAR065456)

d) SID 861574: Lot \# 2 (PHAR065456) with $\mathrm{NH}_{4} \mathrm{Cl}$ added

Figure 13. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz, DMSO- $_{6}$ ) stack plot of a) STOCK4S-15512, b) PHAR065456, c) $1: 1$ mixture of STOCK4S-15512 and PHAR065456, d) PHAR065456 with $\mathrm{NH}_{4} \mathrm{Cl}$ added.

An LC/MS/UV analysis was performed on SID 861574, which showed 260 (retention time $\left.=10.91 \mathrm{~min}, \mathrm{MS}(\mathrm{ESI}+) \mathrm{m} / \mathrm{z} 320[\mathrm{M}+\mathrm{H}]^{+}\right)$to be the major component of the sample along with two other impurities ( $<5 \%$ by ${ }^{1} \mathrm{H}$ NMR) having retention times of 13.31 and 16.51 min (Figure 14). While the peak at 13.31 min ionized (ESI+) poorly and its origin remains unknown, the peak at 16.51 min was found to have a $m / z=411$. This mass was consistent with a compound having the structure of $266\left(m / z=411[M+H]^{+}\right)$, which was synthesized by the reaction of 265 (see Scheme 42 for synthesis) with ethyl 4-isocyanatobenzoate in the presence of

DIPEA (Scheme 41). A direct LC/MS/UV comparison of $\mathbf{2 6 6}$ with SID 861574 showed a match between 266 and the impurity at 16.51 min in SID 861574 by both retention time and mass (Figure 14c). As a result, 266 is very likely an impurity contained in the original sample of SID 861574, and, therefore, the biological activity of 266 against Plk1-PBD is also of interest.

Scheme 41. Synthesis of 266, a likely impurity in SID 861574.

### 3.5 INVESTIGATIONS INTO THE DECOMPOSITION OF 260 AND SID 861574

As a result of the differences in biological activity against Plk1-PBD of SID 861574 and 260, along with a thorough analysis of the composition of SID 861574, it was also important to analyze the decomposition patterns of SID 861574 and $\mathbf{2 6 0}$ in wet DMSO. It is plausible that the

[^3]originally tested sample of SID 861574, prepared in an aqueous DMSO solution, may have partially decomposed prior to testing against Plk1-PBD and that a decomposition product of this sample was actually responsible for the initial positive assay result.

### 3.5.1 High temperature decomposition of SID 861574

A high temperature ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ) decomposition experiment was performed on SID 861574 by heating a sample of this compound to $90{ }^{\circ} \mathrm{C}$ for 3 h in DMSO- $\mathrm{d}_{6}$. The experiment showed decomposition of the sample to predominately yield one product. We suspected that this decomposition product had the structure 265 as shown in Scheme 42. To confirm this structure, compound 265 was synthesized by an independent route, initially forming the allyl ester 267 via the one pot reaction of diallyl 3-oxopentanedioate (268) with ethyl 4-isocyanatobenzoate as described above. ${ }^{106}$ Allyl ester 267 was then reacted with $5.0 \mathrm{~mol} \% \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ in the presence of excess morpholine to cleave the allyl ester, following which decarboxylation was found to be spontaneous, forming 265 in 74\% yield after acidification. Compound 265 was found to exist as a 4:1 mixture of tautomers in DMSO- $\mathrm{d}_{6}$ by ${ }^{1} \mathrm{H}$ NMR. The most characteristic peaks for this tautomeric pair are the $C_{5}-\mathrm{H}$ resonances at $\delta 5.36$ and 5.25 (Figure 15b and 15d).

Scheme 42. Synthesis of thermal decomposition fragment 265.

To confirm that compound 265 was the genuine high temperature decomposition product of 260, a $3: 2$ mixture of $\mathbf{2 6 0 : 2 6 5}$ was prepared in $\mathrm{DMSO}-\mathrm{d}_{6}$. This mixture was heated to $110{ }^{\circ} \mathrm{C}$ for 30 min . After cooling to room temperature, ${ }^{1} \mathrm{H}$ NMR showed a nearly complete decomposition of $\mathbf{2 6 0}$ to 265 and EtOH , confirming the structure of 265 as the thermal decomposition product of 260 (and therefore SID 861574) in DMSO (Figure 15). Compound 265 is thought to arise via the decomposition pathway shown in Scheme 43, in which an initial retro [4+2] reaction of 260 generates the corresponding $\alpha$-oxo ketene intermediate 269, which then either reacts with the eliminated EtOH to reform 260 or with $\mathrm{H}_{2} \mathrm{O}$ (present in DMSO) to form the dicarboxylic acid intermediate 270. ${ }^{107,108}$ Intermediate 270, may then either undergo a retro [4+2] reaction to reform $\mathbf{2 6 9}$ or irreversibly decarboxylate to form the final product 265.

Scheme 43. Proposed high temperature decomposition pathway for $\mathbf{2 6 0}$ to 265 in wet DMSO.

### 3.5.2 Room temperature decomposition of $\mathbf{2 6 0} \mathrm{vs}$. SID 861574

The room temperature decomposition of a concentrated sample of compound 260 in wet DMSO$d_{6}$ was monitored over 6 weeks (Figure 16a). It was found that over this time period 260 underwent a hydrolytic decomposition relatively cleanly to afford predominantly two products. The structure of the first decomposition product was found through synthesis and ${ }^{1} \mathrm{H}$ NMR comparison to be that of 271 (Figure 16b, Scheme 44a). Compound 272 was also synthesized via a modification of a procedure reported by Pericas et. al. for ${ }^{1} \mathrm{H}$ NMR comparison due to the expected similarity in the ${ }^{1} \mathrm{H}$ NMR resonances for compound 272 vs. 271. ${ }^{106}$ This experiment ruled out the possibility of the ${ }^{1} \mathrm{H}$ NMR resonances in Figure 16a to arise from 272 (Scheme 44b). The second room temperature decomposition product was found to be consistent with the high temperature decomposition product 265 (Figure 16c).
a) Compound $\mathbf{2 6 0}$ after 6 weeks at room temperature in wet DMSO- $\mathrm{d}_{6}$

Figure 16. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\mathrm{DMSO}-\mathrm{d}_{6}$ ) stack plot for the room temperature decomposition of $\mathbf{2 6 0}$ over 6 weeks into compounds 271, 265 and ethanol.
a)

Scheme 44. Synthesis of possible decomposition products of 260, 271 and 272.

A control ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ) experiment of the room temperature decomposition of two samples of $\mathbf{2 6 0}$ was performed over 9 weeks (Figure 17). Both samples contained 2.5 mg of 260 in 1.0 mL of DMSO- $\mathrm{d}_{6}$ containing $2.0 \mu \mathrm{~L}$ deionized water, however, one sample was doped with 1.3 equiv. $\mathrm{NH}_{4} \mathrm{Cl}$ (Figure 17b) and the other was not (Figure 17a). As can be inferred by comparison with Figure 16a, both the rate and complexity of the decomposition of $\mathbf{2 6 0}$ appears to be enhanced in DMSO solutions heavily saturated with water. While 271 and 265 were detected in these spectra, the identities of the other decomposition products remain unknown. A comparison of the NMR spectra between the $\mathrm{NH}_{4} \mathrm{Cl}$ doped sample and the non-doped sample shows only slight differences in both the rate and extent of decomposition of $\mathbf{2 6 0}$ over the period studied. After 9 weeks, both samples were stored at $-20^{\circ} \mathrm{C}$ to suppress further decomposition before biological testing against Plk1-PBD. The ${ }^{1} \mathrm{H}$ NMR decomposition profile of a sample of SID 861574 stored under similar conditions was found to match the results of this control experiment (Figure 17c). These experiments reveal the instability of SID 861574 in wet DMSO
solutions and may provide a possible link between the decomposition of SID 861574 and the biological activity against Plk1-PBD.

Figure 17. Comparison of the room temperature decomposition patterns in wet DMSO- $\mathrm{d}_{6}$ of a) compound 260, b) a mixture of 260 and $\mathrm{NH}_{4} \mathrm{Cl}$ and c) SID 861574.

### 3.6 INITIAL BIOLOGICAL TESTING RESULTS AGAINST PLK1-PBD

Initially, three compounds were submitted for biological testing against Plk1-PBD (Figure 18, Table 12): a) compound 260, batch DMA-NB205-92, a resynthesis of SID 861574, b) compound 267, batch DMA-NB245-4, the allyl ester analogue of 260 and c) compound 265, batch DMA-NB245-3, the freshly synthesized high temperature decomposition product of $\mathbf{2 6 0}$. Of these
three compounds, only 265 was found to inhibit Plk1-PBD with an $\mathrm{IC}_{50}$ of $2.079 \mu \mathrm{M}$. Following this result, an optimized synthesis of $\mathbf{2 6 5}$ was developed and the product of this reaction DMA-NB245-24 was submitted along with the previous samples and two additional closely structurally related compounds 234 and 239 for biological testing against Plk1-PBD. Curiously, of these samples again only compound 265 batch DMA-NB245-3 and not compound 265 batch DMA-NB245-24 was active against Plk1-PBD. This result strongly suggested that an impurity in the sample 265 batch DMA-NB245-3 ( $\sim 90 \%$ pure) and not in DMA-NB245-24 ( $\geq 95 \%$ pure) was responsible for the positive assay result. As can be seen from table 12, it was also found that 265 batch DMA-NB245-3 slightly decreased in potency from the first to the second testing. This decrease in potency may reflect the stability of the active agent in the sample over a storage period of 3 months.

### 3.7 IDENTIFICATION AND SYNTHESIS OF PUTATIVE IMPURITIES FOUND IN THE BIOLOGICALLY ACTIVE BATCH OF COMPOUND 265,

 DMA-NB245-3As a result of the large difference in biological activities between 265, batches DMA-NB245-3 and DMA-NB245-24, a thorough analysis of these samples by LC/MS/UV and ${ }^{1} \mathrm{H}$ NMR was conducted. The LC/MS/UV analysis (Figure 19) reveals a predominant impurity at 12.70 min having a mass of $m / z 335(\mathrm{M}+\mathrm{H})^{+}$in the active sample DMA-NB245-3. However, this impurity was absent in the inactive sample DMA-NB245. A ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $\mathrm{d}_{6}$ ) of $\mathbf{2 6 5}$ batch DMA-NB245-3 showed this sample to contain $\sim 5-7 \%$ of an impurity having distinctive aromatic resonances at $\delta 7.89$ (d) and $7.68(\mathrm{~m})$ (see figure 21 a for ${ }^{1} \mathrm{H}$ NMR). Initially, we sought to identify this potentially active impurity through synthesis and isolation, by scaling up the synthetic route used to synthesize 265 batch DMA-NB245-3 200-fold (Scheme 45).

## $\mathrm{MeOH} .{ }^{\mathrm{a}}$

In the first step of this scale up synthesis, the sodium salt of $\mathbf{2 6 8}$ was generated and reacted with isocyanate 203 to form adduct 273, which was cyclized by heating in THF to give an approximately 2:1:0.5:trace mixture of 274a: 274b: 274c: 274d after acidification and recrystallization. ${ }^{106}$ This mixture was then subjected to the deallylation conditions used for the synthesis of 265, batch DMA-NB245-3. A mixture of 247a-d was reacted with $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ in the presence of 10 equiv. morpholine in THF at room temperature for 1.5 h , followed by saponification of the ethyl ester by reaction with 1.0 M NaOH , providing 1.89 g of 265 in $62 \%$ yield ( $\sim 90 \%$ purity by ${ }^{1} \mathrm{H}$ NMR) after acidification with HCl . This sample contained the identical impurity peaks by ${ }^{1} \mathrm{H}$ NMR as seen in batch DMA-NB245-3. After five recrystallizations from THF or EtOAc and hexanes, the majority of 265 was removed from the sample and the ratio of the impurity to 265 was enriched from 7:93 to $32: 68$ as judged by ${ }^{1} \mathrm{H}$

[^4]NMR. However, other unidentified impurities also remained in the sample. Following this series of recrystallizations, other methods were utilized to separate the remaining 32 mg of enriched sample. Unfortunately, isolation attempts by column chromatography, prep TLC, semiprep SFC, MPLC and HPLC failed to produce any pure samples. A sample from the remainder of this mixture was saved for further biological testing against Plk1-PBD (265, batch DMA-NB245-38). The identities of many of the impurities in this sample were finally determined after an elaborate series of experiments designed to optimize the synthesis of 265 with respect to the unknown but desired impurity(s). The interesting impurity profile of this sample will be discussed shortly.

$1.89 \mathrm{~g}, \sim 90 \%$ pure

Scheme 45. Scale up synthesis of 265 batch DMA-NB245-3.

Trials toward the optimization of the reaction conditions for the synthesis of 265 with respect to the desired impurity(s) identified by ${ }^{1} \mathrm{H}$ NMR in the biologically active sample of $\mathbf{2 6 5}$, batch DMA-NB245-3, are depicted in Table 13. As can be seen from entries 1-4, the deallylation of 274 in the presence of high loadings of $\operatorname{Pd}(0)$ catalyst and morpholine (10 equiv.) led to higher percentages of the desired impurity(s) in the crude reaction mixtures as determined by ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{DMSO}-\mathrm{d}_{6}$ ). Entry 3 demonstrates that in the absence of an amine, the reaction product 265 acts as an allyl scavenging agent, forming a high percentage of the allylated reaction byproducts 277 and 278 in the crude reaction mixtures. The appearance of the impurity(s) of interest was also ruled out as arising from a side reaction of $N$-allylmorpholine (276), formed as a necessary byproduct in these reactions (Table 13, entries 4 and 7).

As a result of the correlation between higher percentages of the impurity in the crude reaction product mixtures with higher loadings of the $\operatorname{Pd}(0)$ catalyst, it was thought that possibly the $\mathrm{Pd}(\mathrm{II})$ formed in these reaction mixtures was responsible for catalyzing the reaction to the desired impurity(s). To test this hypothesis, the deallylation of 274 in the presence of $\operatorname{Pd}(\mathrm{OAc})_{2}$ was explored with different catalyst loadings. The reaction succeeded at $60^{\circ} \mathrm{C}$, and catalyst loadings between 50-100 $\mathrm{mol} \%$ were necessary for maximizing (32-35\%) the percentage of the desired impurity(s) in these crude mixtures (Table 13, entries 5-9). Interestingly, entries 10-11 show that heating mixtures of $\mathbf{2 6 7}$ or $\mathbf{2 6 5}$ to $60^{\circ} \mathrm{C}$ in the presence of $\mathrm{Pd}(\mathrm{OAc})_{2}$ and morpholine also led to the formation of the desired impurity(s). Attempts to run this reaction in the presence of $\mathrm{ZnCl}_{2}$ or in the absence of a Lewis acidic catalyst resulted in a large decrease in the formation of the desired impurity(s) by ${ }^{1} \mathrm{H}$ NMR (Table 13, entries 12 and 13). Finally, the optimized reaction conditions were found. The reaction of 265 in the presence of one equivalent of
$\operatorname{Pd}(\mathrm{OAc})_{2}$ at $60{ }^{\circ} \mathrm{C}$, in the absence of morpholine, generated a $1: 1$ mixture of $\mathbf{2 6 5 : 2 7 9}$ as determined by ${ }^{1} \mathrm{H}$ NMR integration (Table 13, entry 14 vs.15). These results suggest that the impurity(s) observed in sample 265 batch DMA-NB245-3 originate from a nucleophilic $\left(\mathrm{H}_{2} \mathrm{O}\right.$, morpholine) ring opening reaction of product $\mathbf{2 6 5}$ that takes place in the presence of Lewis acidic palladium (II) salts.

 ${ }^{\mathrm{d}}$ Compound(s) suspected of biological activity. ${ }^{\circ}$ Precentage of other reaction byproducts. ${ }^{\mathrm{t}}$ Less than $5 \%$. ${ }^{\mathrm{g}}$ Not Determined.

The structure of the putative impurity 279 formed in Table 13, entry 15 was confirmed after scaling up the reaction and carefully recrystallizing the products until the "impurity" was
isolated in $\sim 85-95 \%$ purity by ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $\mathrm{d}_{6}$ ). The product of this reaction was then directly compared to a genuine sample of $\mathbf{2 7 9}$ synthesized according to the route shown in Scheme 46. ${ }^{104}$ Initial attempts to synthesize 279 by the reaction of ethyl 4-aminobenzoate with anhydride 282, prepared according to a known literature procedure, were unsuccessful due to the spontaneous decarboxylation of $\mathbf{2 8 3}$ to form $\mathbf{2 8 4}$ which was isolated in $28 \%$ yield. ${ }^{109,110}$ The reaction of anhydride 282 with 4-aminobenzoic acid 223, however, resulted in the formation of the desired dicarboxylic acid 279 which was found to be more stable toward decarboxylation than the ethyl ester analogue 283. A ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{DMSO}-\mathrm{d}_{6}\right)$ comparison of 279 (isolated from Table 13, entry 15) and the freshly synthesized sample of 279 showed these samples to be identical. For further ${ }^{1} \mathrm{H}$ NMR comparisons and biological testing purposes, 279 was heated in toluene to form the decarboxylated analogue 285 in $86 \%$ yield.

Scheme 46. Synthesis of putative impurities 279 and 285 thought to be contained in 265 batch DMA-NB245-3.

This analysis provided an optimized procedure, resulting in the isolation of 279 as a possible impurity contained in the original sample of 265 batch DMA-NB245-3. Compound 279, while a good match by ${ }^{1} \mathrm{H}$ NMR to the major impurity resonances in DMA-NB245-3, was found to differ by LC/MS from the major impurity contained in this sample. Consistent with both the ${ }^{1} \mathrm{H}$ NMR and LC/MS data for the major impurity in 265 batch DMA-NB245-3 is compound 280 (Scheme 47). Compound 280 may arise in 265 batch DMA-NB245-3 via a similar mechanism to that leading to compound 279, with morpholine acting as the nucleophile opening the ring in compound 265.

Scheme 47. Synthesis of the putative impurity 280 contained in 265 batch DMA-NB245-3.

Compound 280 was synthesized according to the route shown in Scheme 47. Initially, 1.5 equiv. of $\mathbf{2 8 6}$ were reacted with ethyl 4-aminobenzoate $\mathbf{2 2 2}$ in the presence of ZnO at reflux in toluene to afford the amide 287 in $63 \%$ yield. Reaction of 287 with morpholine under the same reaction conditions generated 288 in $\mathbf{4 4 \%}$ yield. The ethyl ester of $\mathbf{2 8 8}$ was then saponified in the presence of 3.0 M LiOH , affording 280 in $61 \%$ yield following acidification and recrystallization from MeOH . A direct LC/MS/UV comparison of $\mathbf{2 8 0}$ and 265 batch DMA-NB245-3 was performed. As can be seen in Figure 20, compound 280 was identical in terms of both mass and retention time to the major impurity contained in 265 batch DMA-NB245-3. Compound 280 was also found to match the major impurity peaks found within 265 batch DMA-NB245-3 by ${ }^{1} \mathrm{H}$ NMR (Figure 21).

Figure 20. LC/MS/UV comparison of a) compound 265 batch DMA-NB245-3, and b) compound 280. Samples prepared as 1 mg substrate in 1 mL DMSO. ${ }^{\text {a }}$

[^5]a) ${ }^{1} \mathrm{H}$ NMR of the biologically active sample against PLK1-PBD (265, DMA-NB245-3) in DMSO-d ${ }_{6}$

b) ${ }^{1} \mathrm{H}$ NMR of putative impurity 280 in DMSO-d $\mathrm{d}_{6}$

Figure 21. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $\mathrm{d}_{6}$ ) stack plot of a) compound 265 batch DMA-NB245-3 and b) putative impurity 280.

A ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{DMSO}-\mathrm{d}_{6}$ ) comparison of compounds 265, 280, 277, 285, 279 and 260 with 265 batch DMA-NB245-38 (scaled up synthesis of DMA-NB245-3) showed that sample 265 batch DMA-NB245-38 was $\sim 90 \%$ composed of a 51:22:9:8:6:4 ratio of 265:280:277:285:279:260 solvated with $\sim 10 \% \mathrm{MeOH}$. This observation is also supported by LC/MS/UV analysis. The results of this analysis indicate that all of the compounds reported above in sample 265 batch DMA-NB245-38 are likely constituents of the biologically active
sample 265 batch DMA-NB245-3 and are worthy candidates for biological testing against Plk1PBD.

### 3.8 FURTHER SYNTHESIS OF ANALOGUES FOR BIOLOGICAL TESTING AGAINST PLK1-PBD

The different compound structures revealed through the synthesis and decomposition studies of SID 861574 inspired the generation of an additional small set of analogues for biological testing against Plk1-PBD. Through these syntheses, several analogues were constructed in which either the ethyl 4-aminobenzoate or 4-aminobenzoic acid moieties were symmetrically linked over a diarylurea, diarylmalonamide or tricarbonyl framework as shown in Schemes 48-50. Pending further biological testing, these analogues may complement the findings of the above studies and generate a set of SAR data for this class of compounds at the PBD of Plk1.

Scheme 48. Synthesis of tricarbonyl analogues 289 and 290.

Scheme 49. Synthesis of diarylmalonamide analogues 292 and 293.

Scheme 50. Synthesis of diaylurea analogues 294 and 295.

### 3.9 SUMMARY

Through the utilization of a fluorescence polarization assay with recombinant Plk1-PBD to monitor for inhibition of Plk1 via PBD binding by small molecules, a HTS campaign was conducted by the PMLSC and 97,090 compounds were screened as potential Plk1-PBD inhibitors. A total of 11 hits were identified as Plk1 inhibitors with $\mathrm{IC}_{50}<50 \mu \mathrm{M}$, and one (SID 861574, $\mathrm{IC}_{50}=2.41 \pm 0.71 \mu \mathrm{M}$ ) was chosen for further hit-to-probe development. Medicinal chemistry studies resulted in the synthesis of a library of 38 novel analogues based on the assigned structure of SID 861574, all of which where found to be biologically inactive against

Plk1-PBD. A resynthesized sample of the initially proposed structure of SID 861574 was found to be spectroscopically nonequivalent with the originally tested material and inactive against Plk1-PBD. Guided by NMR, IR, MS and X-ray crystallography data, a series of synthetic strategies led to uniquely functionalized 6-hydroxy- and 6-aminouracil scaffolds, all of which were spectroscopically nonequivalent to the originally tested sample of SID 861574. However, due to the characteristic structural features of these compounds as observed through rigorous spectroscopic analysis, the structure of the original HTS hit SID 861574 could be identified. Following an independent synthesis of this compound (260), biological testing again revealed a lack of activity against Plk1-PBD.

Consequently, a thorough investigation of both the synthesis and decomposition profiles of the original SID 861574 sample was conducted. These studies resulted in: a) the identification and synthesis of an impurity (266) contained in the original biologically active sample, b) the synthesis of compounds 265 and 271 resulting from the degradation of this sample, and c) a new set of potentially active analogues revealed through the synthesis of the strongly supported decomposition product 265 of SID 861574, which was found to be transiently active against Plk1-PBD. Testing of two different batches indicated that a separate agent formed during the synthesis of this compound was most likely responsible for the positive assay result. This work culminated in the synthesis of 56 compounds for biological testing against Plk1-PBD. It is hoped that a potent inhibitor of Plk1-PBD may be realized on the backdrop of several closely related analogues. SAR data for the binding of these compounds to Plk1-PBD could afford a scaffold for further hit-to-probe development.

### 4.0 EXPERIMENTAL PART

### 4.1 GENERAL EXPERIMENTAL

All moisture-sensitive reactions were performed under an atmosphere of nitrogen gas and all glassware was either dried in an oven at $140^{\circ} \mathrm{C}$ or flame dried under high vacuum prior to use. THF and $\mathrm{Et}_{2} \mathrm{O}$ were dried by distillation from Na /benzophenone ketyl, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and toluene were purified using an alumina column filtration system. Reactions were monitored by either ${ }^{1} \mathrm{H}$ NMR at 300 MHz in DMSO- $\mathrm{d}_{6}$ or by TLC analysis (EM Science pre-coated silica gel 60 F254 plates, 250 m (layer thickness) and visualization was accomplished with a 254 nm UV light and by staining with a p-anisaldehyde solution ( 2.5 mL of p -anisaldehyde, 2 mL of AcOH , and 3.5 mL of conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ in 100 mL of $\left.95 \% \mathrm{EtOH}\right)$ and a $\mathrm{KMnO}_{4}$ solution $\left(1.5 \mathrm{~g}\right.$ of $\mathrm{KMnO}_{4}$ and 1.5 g of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in 100 mL of a $0.1 \% \mathrm{NaOH}$ solution). Flash chromatography on $\mathrm{SiO}_{2}$ was used to purify the crude reaction mixtures. Melting points were determined using a Laboratory Devices Mel-Temp II. Infrared spectra were determined on a Smiths Detection IdentifyIR FT-IR spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were obtained on a Bruker Avance 300 instrument in $\mathrm{CDCl}_{3}$ unless otherwise noted. Chemical shifts were reported in parts per million with the residual solvent peak used as an internal standard. ${ }^{1} \mathrm{H}$ NMR spectra were recorded at 300 MHz and are tabulated as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=\operatorname{doublet}, \mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad ), number of protons, and coupling constant(s). ${ }^{13} \mathrm{C}$ NMR
spectra were recorded at 76 MHz using a proton-decoupled pulse sequence with a $\mathrm{d}_{1}$ of 3 sec , and are tabulated by observed peak. Mass spectra were obtained on a Micromass Autospec double focusing instrument.

### 4.2 LIBRARY SYNTHESIS

### 4.2.1 Synthesis of 2,8-substituted-quinolinecarboxylic acid sodium salts

General procedure A. Sodium 2-(trifluoromethyl)quinoline-4-carboxylate (10). A suspension of 2-(trifluoromethyl)quinoline-4-carboxylic acid 21 ( $224 \mathrm{mg}, 0.927 \mathrm{mmol}$ ) in an aqueous NaOH solution ( $0.371 \mathrm{~mL}, 0.926 \mathrm{mmol}, 10 \%$ ) was heated at $40-50{ }^{\circ} \mathrm{C}$. After 1 h , the solution turned homogenous and the water was removed in vacuo. The resulting product $\mathbf{1 0}$ (242 $\mathrm{mg}, 99 \%$ ) was isolated as a white solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 9.03$ (d, $1 \mathrm{H}, \mathrm{J}=8.5$ Hz, H-6), 8.15 (s, $1 \mathrm{H}, \mathrm{H}-3$ ), 8.05 (d, $1 \mathrm{H}, J=8.4 \mathrm{~Hz}, \mathrm{H}-9$ ), 7.73 (dt, $1 \mathrm{H}, \mathrm{J}=8.4,1.3 \mathrm{~Hz}, \mathrm{H}-8$ ), $7.44(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=8.3 \mathrm{~Hz}, \mathrm{H}-7)$.

Sodium quinoline-4-carboxylate (9). According to general procedure A, 20 ( $50.0 \mathrm{mg}, 0.289$ mmol ) and aqueous $\mathrm{NaOH}(0.563 \mathrm{~mL}, 0.289 \mathrm{mmol}, 0.513 \mathrm{M})$ were stirred at room temperature for 30 min . The resulting product $9(56.4 \mathrm{mg}, 100 \%)$ was isolated as a white solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (methanol-d 4 , 300 MHz ) $\delta 8.85$ (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 8.47 (br, $1 \mathrm{H}, \mathrm{H}-5$ ), 8.04 (br, $1 \mathrm{H}, \mathrm{H}-8$ ), 7.76 (br, 1 H, H-7), 7.61 (br, 2 H, H-6, H-2).

Sodium 2-cyclopropylquinoline-4-carboxylate (11). According to general procedure A, 22 ( $400 \mathrm{mg}, 1.88 \mathrm{mmol}$ ) and aqueous $\mathrm{NaOH}\left(0.750 \mathrm{~mL}, 1.88 \mathrm{mmol}, 10 \%\right.$ ) were heated at $40-50{ }^{\circ} \mathrm{C}$ for 1 h . The product $11(440 \mathrm{mg}, 100 \%)$ was isolated as a white solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (methanol- $\mathrm{d}_{4}$ $300 \mathrm{MHz}) \delta 8.18$ (dd, $1 \mathrm{H}, J=8.2,0.8 \mathrm{~Hz}, \mathrm{H}-8), 7.79(\mathrm{~d}, 1 \mathrm{H}, J=8.4 \mathrm{~Hz}, \mathrm{H}-11), 7.53$ (dt, $1 \mathrm{H}, J$ $=8.1,1.4 \mathrm{~Hz}, \mathrm{H}-10), 7.35(\mathrm{dt}, 1 \mathrm{H}, \mathrm{J}=7.5,1.2 \mathrm{~Hz}, \mathrm{H}-9), 7.10(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-5), 2.21-2.12(\mathrm{~m}, 1 \mathrm{H}$, H-3), 1.05-0.99 (m, 4 H, H-1, H-2).

Sodium 2-(furan-2-yl)quinoline-4-carboxylate (12). According to general procedure A, 23 ( $400 \mathrm{mg}, 1.67 \mathrm{mmol}$ ) and aqueous $\mathrm{NaOH}\left(0.699 \mathrm{~mL}, 1.67 \mathrm{mmol}, 10 \%\right.$ ) were heated at $40-50{ }^{\circ} \mathrm{C}$ for 1 h . The product 12 ( $435 \mathrm{mg}, 100 \%$ ) was isolated as a light brown solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (methanol$\left.\mathrm{d}_{4}, 300 \mathrm{MHz}\right) \delta 8.35(\mathrm{~d}, 1 \mathrm{H}, J=8.3 \mathrm{~Hz}, \mathrm{H}-9), 8.04(\mathrm{~d}, 1 \mathrm{H}, J=8.3 \mathrm{~Hz}, \mathrm{H}-12), 7.98(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-$ 6), 7.76-7.69 (m, $2 \mathrm{H}, \mathrm{H}-11, \mathrm{H}-1$ ), 7.54 (t, $1 \mathrm{H}, J=7.5 \mathrm{~Hz}, \mathrm{H}-10$ ), 7.33 (d, $1 \mathrm{H}, J=3.4 \mathrm{~Hz}, \mathrm{H}-3$ ), $6.66(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=3.3,1.7 \mathrm{~Hz}, \mathrm{H}-2)$.

Sodium 2-phenylquinoline-4-carboxylate (13). ${ }^{75}$ According to general procedure A, 24 (500 $\mathrm{mg}, 2.01 \mathrm{mmol}$ ) and aqueous $\mathrm{NaOH}(1.60 \mathrm{~mL}, 2.01 \mathrm{mmol}, 5.0 \%)$ were combined over a 1 h period, affording 13 ( $540 \mathrm{mg}, 99 \%$ ) as a light yellow solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (methanol- $\mathrm{d}_{4}, 300 \mathrm{MHz}$ ) $\delta$ 8.91 (d, 1 H, $J=8.1 \mathrm{~Hz}, \mathrm{H}-11$ ), 8.46 (s, $1 \mathrm{H}, \mathrm{H}-8$ ), $8.15-8.13$ (m, $2 \mathrm{H}, \mathrm{H}-1, \mathrm{H}-5$ ), 8.00 (d, $1 \mathrm{H}, J$ $=8.3 \mathrm{~Hz}, \mathrm{H}-14), 7.56(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=7.0 \mathrm{~Hz}, \mathrm{H}-13), 7.27-7.21$ (m, $4 \mathrm{H}, \mathrm{H}-2, \mathrm{H}-3, \mathrm{H}-4, \mathrm{H}-12)$.

Sodium 2,8-bis(trifluoromethyl)quinoline-4-carboxylate (14). According to general procedure A, 25 ( $279 \mathrm{mg}, 0.901 \mathrm{mmol}$ ) and aqueous $\mathrm{NaOH}(0.360 \mathrm{~mL}, 0.91 \mathrm{mmol}, 10 \%)$ were heated at $40-50{ }^{\circ} \mathrm{C}$ for 1 h . The product $14(210 \mathrm{mg}, 97 \%)$ was isolated as a white solid: ${ }^{1} \mathrm{H}$ NMR (acetone-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 9.28$ (d, $1 \mathrm{H}, J=8.6 \mathrm{~Hz}, \mathrm{H}-8$ ), 8.26 (s, $1 \mathrm{H}, \mathrm{H}-3$ ), 8.05 (d, $1 \mathrm{H}, J$ $=7.1 \mathrm{~Hz}, \mathrm{H}-6), 7.40(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=7.7 \mathrm{~Hz}, \mathrm{H}-7)$.

### 4.2.2 Synthesis of 1-N-alkyl-3- $N$-alkyl-5-chloroacetyl-6-aminouracils

General procedure B. 6-Amino-5-(2-chloroacetyl)-1,3-dimethylpyrimidine-2,4(1H,3H)-
dione (15, DMA-P77). ${ }^{11}$ To a mixture of $36(1.00 \mathrm{~g}, 6.45 \mathrm{mmol})$, chloroacetic acid ( $1.00 \mathrm{~g}, 10.6$ mmol ) and pyridine ( $0.512 \mathrm{~mL}, 6.46 \mathrm{mmol}$ ) was added 2-chloroacetyl chloride 41 ( 0.513 mL , 6.45 mmol ) at room temperature. The reaction mixture was heated to $95^{\circ} \mathrm{C}$ for 1 h under a nitrogen atmosphere. After 1 h , the mixture was cooled to $50^{\circ} \mathrm{C}$ and deionized water ( 20.0 mL ) was slowly added, with vigorous stirring, while cooling the mixture to $0{ }^{\circ} \mathrm{C}$ for 1 h . A white precipitate formed which was isolated by vacuum filtration, washed with additional $\mathrm{H}_{2} \mathrm{O}(15.0$ mL ) and recrystallized from a 3:2 solution of EtOAc and hexanes. The resulting product $\mathbf{1 5}$ (789 mg, 53\%) was isolated as a yellow crystalline solid: Mp 189-190 ${ }^{\circ} \mathrm{C}$; $\operatorname{IR}(\mathrm{KBr}) 3339$, 3154,

1718, 1659, 1608, 1529, 1369, 1150, 781, $651 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} 300 \mathrm{MHz}\right) \delta 10.79$ (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 8.44 (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 4.91 (s, $2 \mathrm{H}, \mathrm{H}-9$ ), 3.31 (s, $3 \mathrm{H}, \mathrm{H}-5$ ), 3.14 (s, $3 \mathrm{H}, \mathrm{H}-3$ ); ${ }^{13} \mathrm{C}-$ NMR (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 189.0(\mathrm{C}-8), 161.2(\mathrm{C}-6), 158.1$ (C-2), 149.4 (C-4), 89.3 (C-7), 51.5 (C-9), 29.7 (C-3), 27.6 (C-5); MS (EI) m/z 231 ( ${ }^{+}, 9$ ), 196 (100), 182 (77), 166 (23), 137 (27), 121 (68), 57 (92); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{Cl}$ 231.0411, found 231.0411.

6-Amino-3-benzyl-5-(2-chloroacetyl)-1-methylpyrimidine-2,4(1H,3H)-dione (16, DMA-
P150). According to general procedure B, 37 ( $400 \mathrm{mg}, 1.73 \mathrm{mmol}$ ) and 2-chloroacetyl chloride 41 ( $0.138 \mathrm{~mL}, 1.73 \mathrm{mmol}$ ) were combined to yield 16 ( $357 \mathrm{mg}, 67 \%$ ) as an off white crystalline solid: Mp 213.5-215 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3436, 3179, 3061, 1714, 1600, 1512, 1433, 1236, 1139, 778, 715, $649 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} 300 \mathrm{MHz}\right) \delta 10.84$ (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 8.52 (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 7.287.21 (m, 5 H, H-7, H-8, H-9, H-10, H-11), 4.97 (s, 2 H, H-5), 4.92 (s, 2 H, H-15), 3.32 (s, 3 H, $\mathrm{H}-3) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta 189.2$ (C-14), 161.0 (C-12), 158.2 (C-2), 149.4 (C-4), 137.3 (C-6), 128.2 (C 2, C-8, C-10), 127.4 (2 C, C-7, C-11), 126.9 (C-9), 89.3 (C-13), 51.3 (C15), 43.6 (C-5), 29.8 (C-3); MS (EI) m/z 307 (M ${ }^{+}$13), 271 (100), 258 (43), 231 (58), 180 (17), 132 (26), 106 (26), 65 (42); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{Cl} 307.0724$, found 307.0718.

6-Amino-5-(2-chloroacetyl)-1-(cyclopropylmethyl)-3-methylpyrimidine-2,4 (1H,3H)-dione (17, DMA-P164). According to general procedure B, 38 ( $220 \mathrm{mg}, 1.12 \mathrm{mmol}$ ) and 2chloroacetyl chloride 41 ( $0.0895 \mathrm{~mL}, 1.12 \mathrm{mmol}$ ) were combined to yield $17(145 \mathrm{mg}, 47 \%)$ as a yellow crystalline solid: Mp 185-186 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3317, 3066, 3010, 1723, 1655, 1603, 1523, 1387, 1144, 1019, $827 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} 300 \mathrm{MHz}\right) \delta 10.96$ (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 8.54 (br, 1 H, H-1), 4.93 (s, $2 \mathrm{H}, \mathrm{H}-12$ ), 3.88 (d, $2 \mathrm{H}, J=6.8 \mathrm{~Hz}, \mathrm{H}-3$ ), 3.15 (s, $3 \mathrm{H}, \mathrm{H}-8$ ), 1.15 (m, $1 \mathrm{H}, \mathrm{H}-$ 4), $0.47-0.39(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H}-5, \mathrm{H}-6) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 189.4$ (C-11), 161.1 (C-9), 157.4 (C-2), 149.6 (C-7), 89.2 (C-10), 51.3 (C-12), 45.8 (C-3), 27.6 (C-8), 9.2 (C-4), 3.5 (2 C, C5, C-6); MS (EI) m/z 271 (M,$~ 9), ~ 236 ~(74), ~ 206(71), ~ 168(82), ~ 139(42), 80(51) ; ~ H R M S ~(E I) ~$ $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{Cl}$ 271.0724, found 271.0731.

6-Amino-5-(2-chloroacetyl)-1-isobutyl-3-methylpyrimidine-2,4(1H,3H)-dione (18, DMAP92). According to general procedure B, 39 ( $250 \mathrm{mg}, 1.27 \mathrm{mmol}$ ) and 2-chloroacetyl chloride 41 ( $0.101 \mathrm{~mL}, 1.27 \mathrm{mmol}$ ) were combined to yield 18 ( $122 \mathrm{mg}, 35 \%$ ) as a white crystalline solid: Mp 184-185 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3488, 3219, 3155, 2970, 1712, 1655, 1611, 1522, 1375, 1231, $773 \mathrm{~cm}^{-}$

6-Amino-1-benzyl-5-(2-chloroacetyl)-3-methylpyrimidine-2,4(1H,3H)-dione (19, DMA-
P143). According to general procedure B, $40(365 \mathrm{mg}, 1.58 \mathrm{mmol})$ and 2-chloroacetyl chloride 41 ( $0.126 \mathrm{~mL}, 1.58 \mathrm{mmol}$ ) were combined to yield 19 ( $350 \mathrm{mg}, 72 \%$ ) as a white crystalline solid: Mp 247-248.5 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3471, 3215, 3157, 1709, 1655, 1616, 1513, 1379, 1236, $772 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} 300 \mathrm{MHz}\right) \delta 10.92$ (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 8.44 (br, $1 \mathrm{H}, \mathrm{H}-1$ ), 7.37-7.21 (m, 5 H , H-5, H-6, H-7, H-8, H-9), 5.21 (s, 2 H, H-3), 4.95 (s, $2 \mathrm{H}, \mathrm{H}-15$ ), 3.18 (s, $3 \mathrm{H}, \mathrm{H}-11$ ), ${ }^{13} \mathrm{C}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 189.4$ (C-14), 161.2 (C-12), 157.6 (C-2), 149.6 (C-10), 135.0 (C-4), 128.5 (2 C, C-5, C-9), 127.3 (C-7), 126.2 (2 C, C-6, C-8), 89.4 (C-13), 51.4 (C-15), 44.8 (C-3), 27.7 (C-11); MS (EI) m/z 307 (M ${ }^{+}$, 19), 272 (100), 258 (40), 139 (7); HRMS (EI) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{Cl}$ 307.0724, found 307.0719.

### 4.2.3 Synthesis of the 2,8-substituted-4-quinoline carboxylic acids

General procedure C. 2-(Trifluoromethyl)quinoline-4(1H)-one (29). ${ }^{9}$ To a vigorously stirred solution of aniline 26 ( $0.456 \mathrm{~mL}, 5.00 \mathrm{mmol}$ ) in polyphosphoric acid ( 6.30 g ) was added 4,4,4-trifluoro-3-oxobutanoate $28(0.731 \mathrm{~mL}, 5.00 \mathrm{mmol})$ over a 2 min period at $100{ }^{\circ} \mathrm{C}$. The reaction mixture was heated to $150{ }^{\circ} \mathrm{C}$ for 2 h under a nitrogen atmosphere. After 2 h of heating, the reaction mixture was cooled to room temperature and neutralized with an aqueous NaOH solution ( $16.0 \mathrm{~mL}, 5.0 \%$ ). A precipitate formed which was isolated by vacuum filtration, washed with excess deionized water and re-dissolved in an aqueous NaOH solution ( $8.00 \mathrm{~mL}, 10$ \%) with gentle heating. The basic solution was filtered and then acidified to a pH of 4.5 with concentrated HCl . The white precipitate which formed was isolated by vacuum filtration, washed with deionized water and recrystallized from a $2: 1$ solution of ethanol and water. The resulting product 29 ( $515 \mathrm{mg}, 46 \%$ ) was isolated as a clear crystalline solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone$\mathrm{d}_{6} 300 \mathrm{MHz}$ ) $\delta 11.19$ (br, $1 \mathrm{H}, \mathrm{H}-11$ ), 8.30 (dd, $1 \mathrm{H}, \mathrm{J}=8.3,1.0 \mathrm{~Hz}, \mathrm{H}-6$ ), 7.96 (d, $1 \mathrm{H}, \mathrm{J}=8.4$ Hz, H-9), 7.85 (td, $1 \mathrm{H}, J=6.9,1.5 \mathrm{~Hz}, \mathrm{H}-8$ ), 7.62 (t, $1 \mathrm{H}, J=7.1 \mathrm{~Hz}, \mathrm{H}-7$ ), 7.04 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-3$ ).

2,8-Bis(trifluoromethyl)quinolin-4(1H)-one (30, DMA-P104). ${ }^{17}$ According to general procedure C, 2-(trifluoromethyl)aniline 27 ( $3.72 \mathrm{~mL}, 30.0 \mathrm{mmol}$ ) and 4,4,4-trifluoro-3oxobutanoate 28 ( $4.38 \mathrm{~mL}, 30.0 \mathrm{mmol}$ ) were reacted over a 2 h period at $150^{\circ} \mathrm{C}$. An alternative workup was preformed in which the product was extracted from the aqueous acidified mixture $(\mathrm{pH}=5)$ with ether $(4 \times 100 \mathrm{~mL})$ and chromatographed on $\mathrm{SiO}_{2}(1: 1 \mathrm{EtOAc}$ : hexanes $)$. The product was recrystallized from hexanes to afford 30 ( $2.66 \mathrm{~g}, 32 \%$ ) as a white crystalline solid: Mp 133-134 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6} 300 \mathrm{MHz}$ ) $\delta 11.75$ (s, $1 \mathrm{H}, \mathrm{H}-11$ ), $8.60(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}$, H-8), 8.29 (d, $1 \mathrm{H}, J=7.5 \mathrm{~Hz}, \mathrm{H}-6$ ), 7.84 (t, $1 \mathrm{H}, J=7.8 \mathrm{~Hz}, \mathrm{H}-7$ ), 7.37 (s, $1 \mathrm{H}, \mathrm{H}-3$ ); MS (EI) m/z $281\left(\mathrm{M}^{+}, 100\right), 261$ (66), 233 (63), 214 (24), 183 (16), 75 (7).

General Procedure D. 4-Bromo-2-(trifluoromethyl)quinoline (31). ${ }^{17}$ To a melt of $\mathrm{POBr}_{3}$ $(1.35 \mathrm{~g}, 4.69 \mathrm{mmol})$ at $75^{\circ} \mathrm{C}$, under a nitrogen atmosphere, was added $29(1.00 \mathrm{~g}, 4.69 \mathrm{mmol})$ over a 15 min period. After the addition, the reaction mixture was heated to $150^{\circ} \mathrm{C}$ for 2 h and then cooled to room temperature. At room temperature, the reaction was quenched by the addition of deionized water ( 20.0 mL ). A white precipitate formed which was extracted from the aqueous mixture with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{~mL})$. The combined organic extracts were washed with a saturated brine solution ( 50.0 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered through a plug of $\mathrm{SiO}_{2}$ and
concentrated by rotary evaporation. The resulting crude solid was recrystallized from ethanol and water to yield 31 ( $652 \mathrm{mg}, 50 \%$ ) as a slightly impure white solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (chloroform-d, $300 \mathrm{MHz}) \delta 8.22$ (m, 2 H, H-6, H-9), 8.01 (s, $1 \mathrm{H}, \mathrm{H}-3), 7.89-7.73$ (m, $2 \mathrm{H}, \mathrm{H}-7, \mathrm{H}-8)$.

4-Bromo-2,8-bis(trifluoromethyl)quinoline (32, DMA-P108). ${ }^{17}$ According to general procedure D, $30(2.01 \mathrm{~g}, 7.13 \mathrm{mmol})$ and $\mathrm{POBr}_{3}(2.05 \mathrm{~g}, 7.13 \mathrm{mmol})$ were combined to yield 32 ( $2.15 \mathrm{~g}, 88 \%$ ) as a white crystalline solid: $\mathrm{Mp} 60-62{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (chloroform-d, 300 MHz ) $\delta$ 8.48 (d, $1 \mathrm{H}, J=8.4 \mathrm{~Hz}, \mathrm{H}-6), 8.23(\mathrm{~d}, 1 \mathrm{H}, J=7.3 \mathrm{~Hz}, \mathrm{H}-8), 8.12(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-3), 7.83(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=$ $7.9 \mathrm{~Hz}, \mathrm{H}-7$ ); MS (EI) m/z 343 (M+, 97), 345 (100), 267 (29), 169 (18), 84 (94).

General procedure E. 2-(Trifluoromethyl)quinoline-4-carboxylic acid (21, DMA-P114). ${ }^{17}$ To a solution of n-butyl lithium in hexanes ( $0.825 \mathrm{~mL}, 1.11 \mathrm{mmol}, 1.34 \mathrm{M}$ ) in THF ( 2.00 mL ) was added, over a 15 min period at $-78{ }^{\circ} \mathrm{C}$, a solution of 4 -bromo-2-(trifluoromethyl)quinoline 31 ( $305 \mathrm{mg}, 1.11 \mathrm{mmol}$ ) in THF ( 0.50 mL ). The reaction mixture was stirred under a nitrogen atmosphere for 2 h and then slowly poured into an Erlenmeyer flask containing an excess of powdered dry ice. This mixture was stirred for 15 min while warming to room temperature and was then diluted with deionized water $(28.0 \mathrm{~mL})$. The resulting aqueous solution was washed
with ether ( $3 \times 10.0 \mathrm{~mL}$ ), acidified to a pH of $3-4$ with an HCl solution ( 1.18 M ) and extracted with EtOAc ( $3 \times 30.0 \mathrm{~mL}$ ). The EtOAc extracts were combined and concentrated by rotary evaporation. The resulting crude solid was recrystallized from EtOAc and hexanes to afford 21 (142 mg, 53\%) as a white crystalline solid: Mp 195.5-197 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3113, 2946, 1728, 1358, 1256, 1199, 1103, 901, 767, $663 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6} 300 \mathrm{MHz}$ ) $\delta 8.96(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=8.6$ Hz, H-6), 8.36 (s, $1 \mathrm{H}, \mathrm{H}-3$ ), 8.28 (d, $1 \mathrm{H}, J=8.4 \mathrm{~Hz}, \mathrm{H}-9), 8.02$ (t, $1 \mathrm{H}, J=8.3 \mathrm{~Hz}, \mathrm{H}-8$ ), $7.95-$ $7.89(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-7) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\right.$ acetone-d $\left._{6}, 75 \mathrm{MHz}\right) \delta 166.6(\mathrm{C}-11), 149.0(\mathrm{C}-8), 147.9\left(\mathrm{q}, J_{C F}=\right.$ $34.6 \mathrm{~Hz}, \mathrm{C}-2), 138.8$ (C-6), 132.0, 131.1 (2 C), 126.8, 126.7, 122.4 (q, $J_{C F}=272.8 \mathrm{~Hz}, \mathrm{C}-1$ ), 118.8 (C-3); MS (EI) m/z 241 ( $\mathrm{M}^{+}, 100$ ), 223 (12), 196 (20), 185 (9), 176 (7), 128 (5); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{11} \mathrm{H}_{6} \mathrm{NO}_{2} \mathrm{~F}_{3}$ 241.0351, found 241.0349.

2,8-Bis(trifluoromethyl)quinoline-4-carboxylic acid (25, DMA-P115). ${ }^{18}$ According to general procedure E, 32 ( $300 \mathrm{mg}, 0.872 \mathrm{mmol}$ ), n-butyl lithium ( $0.65 \mathrm{~mL}, 0.87 \mathrm{mmol}, 1.34 \mathrm{M}$ ) and $\mathrm{CO}_{2}$ (excess dry ice) were converted to 25 ( $144 \mathrm{mg}, 53 \%$ ). The product was obtained as a white crystalline solid: Mp 226-228 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3027, 1710, 1519, 1430, 1361, 1311, 1148, 1036, $781,687 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\right.$ acetone- $\left._{6}, 300 \mathrm{MHz}\right) \delta 12.32(\mathrm{~s}, 1 \mathrm{H}), 9.12(\mathrm{~d}, 1 \mathrm{H}, J=8.7 \mathrm{~Hz}), 8.36$ $(\mathrm{s}, 1 \mathrm{H}), 8.28(\mathrm{~d}, 1 \mathrm{H}, J=7.1 \mathrm{~Hz}), 7.91(\mathrm{t}, 1 \mathrm{H}, J=7.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\right.$ acetone- $\left.\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta$ 166.1, $148.5\left(\mathrm{q}, J_{C F}=35.5 \mathrm{~Hz}\right), 145.0,139.3,131.4,130.6\left(\mathrm{q}, J_{C F}=5.6 \mathrm{~Hz}\right), 129.9,129.0\left(\mathrm{q}, J_{C F}\right.$ $=30.0 \mathrm{~Hz}), 127.5,124.6\left(\mathrm{q}, J_{C F}=271.4 \mathrm{~Hz}\right), 122.0\left(\mathrm{q}, J_{C F}=273.1 \mathrm{~Hz}\right), 119.1 ; \mathrm{MS}(\mathrm{EI}) \mathrm{m} / \mathrm{z} 309$

2-Cyclopropylquinoline-4-carboxylic acid (22, DMA-P121). ${ }^{19}$ A solution of indoline-2,3dione $33(1.00 \mathrm{~g}, 6.80 \mathrm{mmol})$ in aqueous $\mathrm{KOH}(4.00 \mathrm{~mL}, 35.0 \mathrm{mmol}, 8.75 \mathrm{M})$ was stirred for 10 min at room temperature. The solution changed color from black to transparent yellow. To this mixture was added 1-cyclopropylethanone $34(1.01 \mathrm{~mL}, 10.2 \mathrm{mmol})$ and ethanol ( 2.5 mL ). The reaction mixture was heated at reflux for 4.5 h , cooled to $0^{\circ} \mathrm{C}$ and acidified to pH of $5-6$ with glacial acetic acid. A precipitate developed which was isolated by vacuum filtration and was recrystallized from a $10: 1$ solution of EtOAc and hexanes to afford $22(1.13 \mathrm{~g}, 78 \%)$ as a white crystalline solid: Mp 214-214.8 ${ }^{\circ} \mathrm{C}$; $\mathrm{IR}(\mathrm{KBr}) 3448,3095,3007,1667,1616,1405,1338,882$, $772 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\left.\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 8.74(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=8.6,0.8 \mathrm{~Hz}, \mathrm{H}-11), 7.97-7.94(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{H}-5, \mathrm{H}-8), 7.74$ (dt, $1 \mathrm{H}, J=7.6,1.4 \mathrm{~Hz}, \mathrm{H}-10), 7.57$ (dt, $1 \mathrm{H}, J=7.7,1.4 \mathrm{~Hz}, \mathrm{H}-9$ ), $2.43-$ 2.34 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{H}-3$ ), $1.23-1.07$ ( $\mathrm{m}, 4 \mathrm{H}, \mathrm{H}-1, \mathrm{H}-2$ ); ${ }^{13} \mathrm{C}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6}, 75 \mathrm{MHz}$ ) $\delta 169.7$ (C13), 164.9 (C-4), 147.6 (C-12), 142.3 (C-6), 131.9 (C-10), 128.2 (C-11), 127.4 (C-9), 127.3 (C5), 124.9 (C-8), 120.1 (C-7), 18.1 (C-15), 11.6 (C 2, C-1, C-2); MS (EI) $m / z 213\left(\mathrm{M}^{+}, 60\right), 212$ (100), 187 (14), 167 (63), 128 (12); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{13} \mathrm{H}_{11} \mathrm{NO}_{2} 213.0790$, found 213.0784.

2-(Furan-2-yl)quinoline-4-carboxylic acid (23, DMA-P117). ${ }^{20}$ A solution of indoline-2,3dione $33(1.00 \mathrm{~g}, 6.80 \mathrm{mmol})$ in aqueous $\mathrm{KOH}(4.00 \mathrm{~mL}, 35.0 \mathrm{mmol}, 8.75 \mathrm{M})$ was stirred for 10 min at room temperature. The solution turned from black to transparent yellow. To this mixture was added 1-(furan-2-yl)ethanone $35(1.02 \mathrm{~mL}, 10.2 \mathrm{mmol})$. The reaction mixture was heated at reflux for 4.5 h , cooled to room temperature and acidified to pH of 3-4 with concentrated hydrochloric acid (36 \%). A precipitate developed which was isolated by vacuum filtration, dissolved in a solution of $10: 1 \mathrm{EtOAc}: \mathrm{MeOH}$ and filtered through a plug of silica gel. The solvents were then removed by rotary evaporation and the resulting orange solid was recrystallized three times from a 3:1 solution of ethanol and water to afford 23 ( $548 \mathrm{mg}, 34 \%$ ) as a brown solid: Mp 234-237 ${ }^{\circ} \mathrm{C}$ (dec.); IR (KBr) 3435, 3141, 1714, 1600, 1372, 1232, 1018, 761 $\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 8.82(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=8.5,0.8 \mathrm{~Hz}, \mathrm{C}-12), 8.44(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}-6)$, 8.11 (dd, $1 \mathrm{H}, J=8.5,0.6 \mathrm{~Hz}, \mathrm{C}-9$ ), $7.85-7.64$ (m, $2 \mathrm{H}, \mathrm{H}-1, \mathrm{H}-11$ ), 7.66 (dt, $1 \mathrm{H}, J=7.8,1.3$ $\mathrm{Hz}, \mathrm{H}-10), 7.40(\mathrm{dd}, 1 \mathrm{H}, J=3.4,0.7 \mathrm{~Hz}, \mathrm{H}-3), 6.72(\mathrm{dd}, 1 \mathrm{H}, J=3.4,1.6 \mathrm{~Hz}, \mathrm{H}-2) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ (acetone- $\left.\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta 167.4$ (C-14), 154.2 (C-4), 150.0 (C-5), 149.5 (C-13), 145.7 (C-1), 137.0 (C-7), 131.0 (C-11), 130.5 (C-12), 128.4 (C-10), 126.6 (C-9), 124.8 (C-6), 119.3 (C-8), 113.4 (C3), 111.3 (C-2); MS (EI) m/z 239 ( $\mathrm{M}^{+}, 100$ ), 211 (16), 166 (25), 140 (20), 110 (26); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{14} \mathrm{H}_{9} \mathrm{NO}_{3}$ 239.0582, found 239.0590.

### 4.2.4 Synthesis of the 1-N-alkyl-3-N-alkyl-6-aminouracils

1-Benzylurea (44, DMA-P105). ${ }^{21}$ Neat phenylmethanamine $42(5.00 \mathrm{~g}, 46.7 \mathrm{mmol})$ was added to an aqueous HCl solution ( $39.4 \mathrm{~mL}, 46.5 \mathrm{mmol}, 1.18 \mathrm{M}$ ) at room temperature. This solution was stirred for 5 min, diluted with deionized water ( 100 mL ) and then mixed with an aqueous solution of potassium cyanate ( $40.0 \mathrm{~mL}, 70.0 \mathrm{mmol}, 1.75 \mathrm{M}$ ). The reaction mixture was stirred for 30 h and the resulting precipitate was removed by vacuum filtration. The isolated solid was then recrystallized from a 1:3 solution of ethanol and water affording $44(4.04 \mathrm{~g}, 58 \%)$ as large colorless crystals: $\mathrm{Mp} 151-152{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\right.$ acetone $\left.-\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 7.49-7.17$ (m, $5 \mathrm{H}, \mathrm{H}-6$, H-7, H-8, H-9, H-10), 6.07 (br, $1 \mathrm{H}, \mathrm{H}-3$ ), 5.22 (br, $2 \mathrm{H}, \mathrm{H}-1$ ), 4.27 (d, $2 \mathrm{H}, \mathrm{J}=12.0 \mathrm{~Hz}, \mathrm{H}-4$ ).

1-(Cyclopropylmethyl)urea (45, DMA-P126). ${ }^{22}$ To a solution of cyclopropylmethanamine hydrochloride 43 ( $3.00 \mathrm{~g}, 27.9 \mathrm{mmol}$ ) in deionized water ( 60.0 mL ) was added an aqueous solution of potassium cyanate ( $20.0 \mathrm{~mL}, 41.8 \mathrm{mmol}, 2.10 \mathrm{M}$ ) at room temperature. The reaction mixture was stirred for 44 h and then extracted with EtOAc (11 x 100 mL ). The combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting solid was recrystallized from a 9:1 solution of EtOAc and hexanes affording 45 ( $2.31 \mathrm{~g}, 76 \%$ ) as colorless crystals: $\mathrm{Mp} 121-122{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 5.84$ (br, $1 \mathrm{H}, \mathrm{H}-3$ ), 5.25
(br, $2 \mathrm{H}, \mathrm{H}-1$ ), 2.97 (t, $2 \mathrm{H}, \mathrm{J}=6.0 \mathrm{~Hz}, \mathrm{H}-4$ ), $0.87-0.96$ (m, $1 \mathrm{H}, \mathrm{H}-5$ ), 0.12-0.42 (m, $4 \mathrm{H}, \mathrm{H}-6$, H-7).

$N$-(Benzylcarbamoyl)-2-cyanoacetamide (47). ${ }^{23}$ A solution of 1-benzylurea 44 (3.84 g, 25.6 mmol ) and 2-cyanoacetic acid $46(2.40 \mathrm{~g}, 28.2 \mathrm{mmol})$ in acetic anhydride ( 30.0 mL ) was heated to $77{ }^{\circ} \mathrm{C}$ for 1.25 h . After 1.25 h , the reaction mixture was cooled to room temperature and a pale yellow precipitate formed. The reaction mixture was then diluted with ether ( 50.0 mL ) and cooled to $0{ }^{\circ} \mathrm{C}$ for 30 min . The resulting precipitate was isolated by vacuum filtration, washed with ether ( 30.0 mL ) and dried in vacuo. The crude product 47 ( $4.18 \mathrm{~g}, 75 \%$ ) was used for the next step without further purification: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta 9.83$ (br, $1 \mathrm{H}, \mathrm{H}-4$ ), 8.50 (br, 1 H, H-6), 7.26-7.37 (m, 5 H, H-9, H-10, H-11, H-12, H-13), 4.48 (d, $2 \mathrm{H}, \mathrm{J}=12.0 \mathrm{~Hz}$, H-7), 3.93 (s, $2 \mathrm{H}, \mathrm{H}-2$ ).

2-Cyano- N -(cyclopropylmethylcarbamoyl)acetamide (48, DMA-P130). ${ }^{22}$ A solution of 1(cyclopropylmethyl)urea $45(2.28 \mathrm{~g}, 20.0 \mathrm{mmol})$ and 2-cyanoacetic acid $46(1.87 \mathrm{~g}, 22.0 \mathrm{mmol})$ in acetic anhydride ( 23.0 mL ) was heated to $77^{\circ} \mathrm{C}$ for 1 h . The reaction mixture was then cooled to room temperature and the solvent was removed by rotary evaporation. The resulting crude residue was recrystallized twice from a 5:1 solution of EtOAc and hexanes affording 48 (2.02 g,
$56 \%$ ) as a light orange crystalline solid: $\mathrm{Mp} 162-163{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$-NMR (acetone- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 9.62$ (br, $1 \mathrm{H}, \mathrm{H}-4$ ), 8.12 (br, $1 \mathrm{H}, \mathrm{H}-6$ ), 3.93 (s, 2H, H-2), 3.11-3.16 (m, $2 \mathrm{H}, \mathrm{H}-7$ ), 0.97-1.10 (m, 1 H, H-8), 0.21-0.50 (m, 4 H, H-9, H-10); MS (EI) m/z 181 (M ${ }^{+}$, 8), 166 (9), 153 (58), 97 (67), 85 (100), 70 (99), 54 (79).

6-Amino-1-benzylpyrimidine-2,4(1H,3H)-dione (49, DMA-P111). ${ }^{13}$ A suspension of 47 (4.15 g, 19.1 mmol ) in deionized water ( 25.0 mL ) and ethanol ( 2.50 mL ) was heated to $85-90^{\circ} \mathrm{C}$. To this mixture was added a NaOH solution $(4.89 \mathrm{~mL}, 10 \%)$ and the reaction mixture was heated for 1 h . A white precipitate developed. After 1 h of heating, the reaction mixture was cooled to room temperature and acidified to pH 7 with an HCl solution $(1.18 \mathrm{M})$. The neutralized reaction mixture was then diluted with deionized water ( 30.0 mL ) and cooled to $0{ }^{\circ} \mathrm{C}$. The resulting white precipitate was isolated by vacuum filtration, washed with deionized water ( 30.0 mL ) and recrystallized from a $1: 10$ solution of methanol and EtOAc. The resulting product 49 ( 2.08 g , $50 \%$ ) was obtained as a white crystalline solid: Mp 283-284 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 10.50$ (br, 1 H, H-11), 7.17-7.36 (m, 5 H, H-5, H-6, H-7, H-8, H-9), 6.78 (br, 2 H, H-1), 5.02 (s, $2 \mathrm{H}, \mathrm{H}-3$ ), 4.60 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-13$ ); MS (EI) m/z 217 (M ${ }^{+}$25), 91 (100), 78 (55), 63 (75).

6-Amino-1-(cyclopropylmethyl)pyrimidine-2,4(1H,3H)-dione (50, DMA-P132). ${ }^{24}$ A suspension of $48(1.99 \mathrm{~g}, 11.0 \mathrm{mmol})$ in deionized water ( 20.0 mL ) and ethanol ( 1.50 mL ) was heated to $85-90^{\circ} \mathrm{C}$. To this mixture was added a NaOH solution ( $2.80 \mathrm{~mL}, 10 \%$ ). The reaction mixture was heated for 1 h , cooled to room temperature and acidified to pH 7 with an HCl solution $(1.18 \mathrm{M})$. The neutralized reaction mixture was then cooled to $0{ }^{\circ} \mathrm{C}$ and a light orange crystalline precipitate formed which was isolated by vacuum filtration and dried in vacuo. The resulting product 50 ( $0.71 \mathrm{~g}, 36 \%$ ) was obtained as a light orange crystalline solid: Mp 265-266 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 300 \mathrm{MHz}\right) \delta 10.29$ (br, $1 \mathrm{H}, \mathrm{H}-8$ ), 6.77 (br, $2 \mathrm{H}, \mathrm{H}-1$ ), 4.53 (s, $1 \mathrm{H}, \mathrm{H}-$ 10), 3.66 (d, $2 \mathrm{H}, J=6.6 \mathrm{~Hz}, \mathrm{H}-3$ ), 1.07-1.15 (m, $1 \mathrm{H}, \mathrm{H}-4$ ), $0.33-0.45$ (m, $4 \mathrm{H}, \mathrm{H}-5, \mathrm{H}-6$ ); MS (EI) $m / z 181\left(\mathrm{M}^{+}, 43\right), 152(14), 127$ (87), 68 (31), 55 (100).

General procedure F. (E)- $N^{\prime}$-(3-Benzyl-2,6-dioxo-1,2,3,6-tetrahydropyrimidin -4-yl)- $\mathrm{N}, \mathrm{N}$ dimethylformimidamide (52, DMA-P113). ${ }^{14}$ To a suspension of $49(1.50 \mathrm{~g}, 6.91 \mathrm{mmol})$ in DMF ( 34.0 mL ) was added DMF-DMA ( $3.72 \mathrm{~mL}, 27.7 \mathrm{mmol}$ ). The reaction mixture was heated to $40^{\circ} \mathrm{C}$ for 24 h under a nitrogen atmosphere. After 24 h , the solvent was removed by rotary evaporation and the crude residue was dissolved in a minimum amount of hot DMSO. The
product was crystallized by slowly adding a 2:1 mixture of hexanes to EtOAc, followed by cooling at $0{ }^{\circ} \mathrm{C}$ for 5 h . The resulting precipitate was isolated by vacuum filtration and dried under high vacuum affording 52 ( $1.42 \mathrm{~g}, 76 \%$ ) as a white crystalline solid: Mp 220-221 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3489, 3126, 2980, 2846, 1651, 1609, 1552, 1347, 1226, $1127 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}\right.$ 300 MHz ) $\delta 10.70$ (br, $1 \mathrm{H}, \mathrm{H}-13$ ), 8.01 (s, $1 \mathrm{H}, \mathrm{H}-3$ ), $7.27-7.16$ (m, $5 \mathrm{H}, \mathrm{H}-7, \mathrm{H}-8, \mathrm{H}-9, \mathrm{H}-10$, H-11), 5.04 (s, $2 \mathrm{H}, \mathrm{H}-5$ ), 4.99 (s, $1 \mathrm{H}, \mathrm{H}-15$ ), 3.02 (s, $3 \mathrm{H}, \mathrm{H}-2$ ), 2.88 (s, $3 \mathrm{H}, \mathrm{H}-1$ ); ${ }^{13} \mathrm{C}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 163.2$ (C-14), 160.3 (C-3), 156.0 (C-4), 151.8 (C-12), 138.5 (C-6), 128.2 (2 C, C-8, C-10), 127.1 (2 C, C-7, C-11), 126.8 (C-9), 82.2 (C-15), 44.2 (C-5), 40.3 (C-2), 34.4 (C-1); MS (EI) m/z 272 (M ${ }^{+}$, 24), 256 (6), 192 (15), 108 (100), 91 (54), 69 (64); HRMS (EI) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{~N}_{4} \mathrm{O}_{2}$ 272.1273, found 272.1274.

## (E)- $N^{\prime}$-(3-(Cyclopropylmethyl)-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl)-N,N-

dimethylformimidamide (53, DMA-P139). According to general procedure F, 50 (673 mg, $3.71 \mathrm{mmol})$ and DMF-DMA ( $19.7 \mathrm{~mL}, 14.9 \mathrm{mmol}$ ) were heated in DMF $(18.0 \mathrm{~mL})$ at $40{ }^{\circ} \mathrm{C}$ for 14 h . ## (E)-N,N-Dimethyl- $N^{\prime}$-(3-methyl-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl)

formimidamide (54, DMA-P128). ${ }^{14}$ According to general procedure F, $51(1.50 \mathrm{~g}, 10.6 \mathrm{mmol})$ and DMF-DMA ( $5.70 \mathrm{~mL}, 42.4 \mathrm{mmol}$ ) were heated in DMF ( 45.0 mL ) at $40^{\circ} \mathrm{C}$ for 8 h . The resulting product 54 ( 1.37 g , $65 \%$ ) was isolated as a white crystalline solid: Mp 254-256 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3155, 3024, 1689, 1655, 1618, 1557, 1359, 1227, 1109, $996 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO-d ${ }_{6}$, 300 MHz ) $\delta 10.61$ (s, $1 \mathrm{H}, \mathrm{H}-7$ ), 8.02 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-3$ ), 4.96 (s, $1 \mathrm{H}, \mathrm{H}-9$ ), 3.33 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{H}-5$ ), 3.13 (s, $3 \mathrm{H}, \mathrm{H}-2), 2.98$ (s, $3 \mathrm{H}, \mathrm{H}-1$ ); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}^{6}, 75 \mathrm{MHz}\right) \delta 163.1$ (C-8), 160.8 (C-3), 155.8 (C-4), 151.8 (C-6), 82.2 (C-9), 40.3 (C-5), 34.4 (C-2), 28.6 (C-3); MS (EI) m/z 196 ( $\mathrm{M}^{+}, 100$ ), 152 (5), 99 (21), 82 (43), 55 (26).

General Procedure G. (E)-N'-(3-Benzyl-1-methyl-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl)- $N$, $N$-dimethylformimidamide (55, DMA-P129). A suspension of 52 ( $797 \mathrm{mg}, 2.93 \mathrm{mmol}$ )
in acetonitrile ( 13.0 mL ) and DMF ( 2.00 mL ) was reacted with $\mathrm{DBU}(0.882 \mathrm{~mL}, 5.85 \mathrm{mmol})$ at $50^{\circ} \mathrm{C}$ for 1 h under a nitrogen atmosphere. After 1 h , the reaction mixture became homogenous and was cooled to room temperature. After addition of iodomethane ( $0.911 \mathrm{~mL}, 14.6 \mathrm{mmol}$ ), the reaction mixture was stirred at room temperature for 2 d and then glacial acetic acid (8 drops) was added. The solvents were removed by rotary evaporation and the crude yellow oil was added to a saturated $\mathrm{NaHCO}_{3}$ solution ( 20.0 mL ). The aqueous phase was extracted with EtOAc $(4 \times 50.0 \mathrm{~mL})$ and the organic layers were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting residue was chromatographed on $\mathrm{SiO}_{2}$ (20:1 EtOAc: methanol). The crude product was recrystallized from a 1:1 solution of EtOAc and hexanes and 55 ( 429.1 mg , $51 \%$ ) was obtained as a white crystalline solid: Mp 163-164 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (methanol- $\mathrm{d}_{4}, 300$ $\mathrm{MHz}) \delta 7.85$ (s, $1 \mathrm{H}, \mathrm{H}-3$ ), 7.19-7.11 (m, $5 \mathrm{H}, \mathrm{H}-7, \mathrm{H}-8, \mathrm{H}-9, \mathrm{H}-10, \mathrm{H}-11$ ), 5.18 (s, $2 \mathrm{H}, \mathrm{H}-5$ ), 5.11 (s, 1 H, H-15), 3.19 (s, $3 \mathrm{H}, \mathrm{H}-13$ ), 3.04 (s, $3 \mathrm{H}, \mathrm{H}-2$ ), 2.94 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{H}-1$ ); MS (EI) m/z 286 ( $\mathrm{M}^{+}, 98$ ), 242 (37), 186 (36), 91 (100).

(E)- $N^{\prime}$-(3-(Cyclopropylmethyl)-1-methyl-2,6-dioxo-1,2,3,6 tetrahydropyrimidin-4-yl)-N,Ndimethylformimidamide (56, DMA-P142). According to general procedure G, 53 (785 mg, 3.32 mmol ), DBU ( $2.50 \mathrm{~mL}, 16.6 \mathrm{mmol}$ ) and iodomethane ( $2.06 \mathrm{~mL}, 33.2 \mathrm{mmol}$ ) were reacted for 3 d . The resulting product 56 ( $382 \mathrm{mg}, 46 \%$ ) was isolated as a colorless crystalline solid: Mp 176-177 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\right.$ methanol $^{2} \mathrm{~d}_{4}, 300 \mathrm{MHz}$ ) $\delta 7.88$ (s, $1 \mathrm{H}, \mathrm{H}-3$ ), 5.07 (s, $1 \mathrm{H}, \mathrm{H}-12$ ), 3.86 (d, $2 \mathrm{H}, J=7.1 \mathrm{~Hz}, \mathrm{H}-5$ ), 3.18 (s, $3 \mathrm{H}, \mathrm{H}-10$ ), 3.08 (s, $3 \mathrm{H}, \mathrm{H}-2$ ), 3.02 (s, $3 \mathrm{H}, \mathrm{H}-1$ ), 1.22-1.14
(m, 1 H, H-6), 0.40-0.27 (m, 4 H, H-7, H-8); MS (EI) m/z 250 ( $\mathrm{M}^{+}, 100$ ), 221 (14), 195 (19), 152 (23), 122 (31), 99 (36), 69 (49), 55 (59); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{12} \mathrm{H}_{18} \mathrm{~N}_{4} \mathrm{O}_{2}$ 250.1430, found 250.1433 .

## (E)-N'-(1-Benzyl-3-methyl-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl)-N,N-

dimethylformimidamide (57, DMA-P131). ${ }^{25}$ According to general procedure G, $54(1.10 \mathrm{~g}$, 5.61 mmol ), DBU ( $1.69 \mathrm{~mL}, 11.2 \mathrm{mmol}$ ) and (bromomethyl)benzene ( $1.33 \mathrm{~mL}, 11.2 \mathrm{mmol}$ ) were heated at $80{ }^{\circ} \mathrm{C}$ for 5 h . The resulting product 57 ( $192 \mathrm{mg}, 15 \%$ ) was isolated as a white solid: Mp 201-202 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3079, 2966, 1683, 1650, 1619, 1573, 1410, 1363, 1112, 760, $694 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6} 300 \mathrm{MHz}\right) \delta 8.08$ (s, $1 \mathrm{H}, \mathrm{H}-3$ ), 7.25 (s, $5 \mathrm{H}, \mathrm{H}-9, \mathrm{H}-10, \mathrm{H}-11, \mathrm{H}-$ 12, H-13), 5.18 (s, 1 H, H-15), 4.94 (s, 2 H, H-7), 3.29 (s, 3 H, H-5), 3.11 (s, 3 H, H-2), 3.00 (s, 3 H, H-1); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 161.9$ (C-14), 159.4 (C-3), 156.0 (C-4), 151.9 (C-6), 138.0 (C-8), 128.1 (2 C, C-10, C-12), 127.4 (2 C, C-9, C-13), 126.8 (C-11), 81.7 (C-15), 43.1 (C7), 34.4 (C-2), 29.6 (C-5) (one signal buried in DMSO- $\mathrm{d}_{6}$, C-1); MS (EI) m/z 286 ( $\mathrm{M}^{+}, 100$ ), 269 (6), 181 (9), 111 (13), 99 (22), 82 (32), 73 (24); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{15} \mathrm{H}_{18} \mathrm{~N}_{4} \mathrm{O}_{2}$ 286.1430, found 286.1440.

## General procedure H. 6-Amino-1-benzyl-3-methylpyrimidine-2,4(1H,3H)-dione (40, DMA-

P136). ${ }^{26}$ An aqueous ammonia solution was prepared by slowly bubbling ammonia gas through deionized water ( 250 mL ) at $0{ }^{\circ} \mathrm{C}$ for 30 min . A portion of the ammonia solution ( 20.0 mL ) was added to 55 ( $658 \mathrm{mg}, 2.30 \mathrm{mmol}$ ) dissolved in methanol ( 20.0 mL ). This mixture was stirred at room temperature in a stoppered flask. After 3 d, the solvents were removed by rotary evaporation and the resulting residue was chromatographed on $\mathrm{SiO}_{2}$ (EtOAc, with a few drops of $\mathrm{Et}_{3} \mathrm{~N}$ ). The product was recrystallized from a $1: 1$ solution of EtOAc and hexanes to afford $\mathbf{4 0}$ (417 mg, 77\%) as a white crystalline solid: Mp 171-172 ${ }^{\circ} \mathrm{C}$; IR ( KBr ) 3357, 3213, 1693, 1663, 1626, 1498, 1454, 1431, 1379, 1283, 1130, 783, $696 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ (methanol- $\mathrm{d}_{4}, 300 \mathrm{MHz}$ ) $\delta$ 7.25-7.11 (m, 5 H, H-5, H-6, H-7, H-8, H-9), 5.04 (br, 2 H, H-1), 4.87 (s, 1 H, H-13), 3.15 (s, 3 $\mathrm{H}, \mathrm{H}-11$ ); ${ }^{13} \mathrm{C}-\mathrm{NMR}$ (methanol-d $\left.{ }_{4}, 75 \mathrm{MHz}\right) \delta 165.6$ (C-12), 157.1 (C-10), 153.7 (C-2), 137.1 (C-4), 129.9 (C 2, C-6, C-8), 128.8 (C-7), 127.5 (2 C, C-5, C-9), 77.1 (C-13), 46.8 (C-3), 28.3 (C-11); MS (EI) m/z 231 (M ${ }^{+}, 100$ ), 173 (7), 145 (9), 111 (7), 106 (11); HRMS (EI) m/z calculated for $\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{2}$ 231.1008, found 231.1005.

6-Amino-1-(cyclopropylmethyl)-3-methylpyrimidine-2,4(1H,3H)-dione (38). ${ }^{27}$ According to general procedure H, 56 ( $350 \mathrm{mg}, 1.40 \mathrm{mmol}$ ) was reacted with an aqueous ammonia solution ( 20 mL ) for 4 d . The crude product 38 ( $220 \mathrm{mg}, 80 \%$ ) was isolated as white solid and was used for the next step without further purification: ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6} 300 \mathrm{MHz}\right) \delta 6.79$ (br, $2 \mathrm{H}, \mathrm{H}-$ 1), 4.68 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{H}-10$ ), 3.72 (d, $2 \mathrm{H}, J=7.1 \mathrm{~Hz}, \mathrm{H}-3$ ), 3.06 (s, $3 \mathrm{H}, \mathrm{H}-8$ ), $1.16-1.11$ (m, $1 \mathrm{H}, \mathrm{H}-$ 4), 0.43-0.32 (m, 4 H, H-5, H-6).

6-Amino-3-benzyl-1-methylpyrimidine-2,4(1H,3H)-dione (37, DMA-P137). ${ }^{28}$ According to general procedure H, 57 ( $756 \mathrm{mg}, 2.64 \mathrm{mmol}$ ) was reacted with an aqueous ammonia solution ( 20 mL ) for 3 d . The concentrated crude reaction mixture was chromatographed on $\mathrm{SiO}_{2}$ (9:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ : methanol). The product 37 ( $446 \mathrm{mg}, 73 \%$ ) was isolated as a white solid: Mp 202-203 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} 300 \mathrm{MHz}\right) \delta 7.29-7.21$ (m, $5 \mathrm{H}, \mathrm{H}-7, \mathrm{H}-8, \mathrm{H}-9, \mathrm{H}-10, \mathrm{H}-11$ ), 6.87 (br, 2 H, H-1), 4.90 (s, $2 \mathrm{H}, \mathrm{H}-5$ ), 4.73 (s, $1 \mathrm{H}, \mathrm{H}-13$ ), 3.23 (s, $3 \mathrm{H}, \mathrm{H}-3$ ); MS (EI) m/z 231 (M ${ }^{+}, 42$ ), 220 (52), 205 (100), 145 (19), 99 (15).

### 4.2.5 Synthesis of the final library analogues

General procedure I. 2-(6-Amino-1,3-dimethyl-2,4-dioxo-1,2,3,4-tetrahydro- pyrimidin-5-yl)-2-oxoethyl 2,8-bis(trifluoromethyl) quinoline-4-carboxylate (63, DMA-P146). A solution of $15(40.5 \mathrm{mg}, 0.175 \mathrm{mmol})$ and $14(60.8 \mathrm{mg}, 0.184 \mathrm{mmol})$ in DMF ( 5.00 mL ) was heated to reflux under a nitrogen atmosphere for 1 h , then cooled to room temperature. The product was precipitated by the slow addition of deionized water ( 20 mL ) over 1 h while the mixture was cooled to $0{ }^{\circ} \mathrm{C}$. The resulting precipitate was isolated by vacuum filtration, washed with deionized water ( 40 mL ), and dried in a Genevac for 17 h at $40^{\circ} \mathrm{C}$ followed by 19 h at $50{ }^{\circ} \mathrm{C}$ to remove residual DMF. The product $63(49.6 \mathrm{mg}, 56 \%)$ was isolated as a white solid: ${ }^{1} \mathrm{H}$-NMR (acetone- $\left.\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 11.04$ (br, $1 \mathrm{H}, \mathrm{H}-17$ ), 9.23 (d, $1 \mathrm{H}, \mathrm{J}=8.6 \mathrm{~Hz}, \mathrm{H}-8$ ), 8.52 (s, $1 \mathrm{H}, \mathrm{H}-3$ ), 8.45 (d, $1 \mathrm{H}, J=7.1 \mathrm{~Hz}, \mathrm{H}-6$ ), 8.07 (t, $1 \mathrm{H}, J=8.0 \mathrm{~Hz}, \mathrm{H}-7$ ), 7.70 (br, $1 \mathrm{H}, \mathrm{H}-17$ ), 5.69 (s, 2 H , H-13), 3.54 (s, 3 H, H-20), 3.28 (s, $3 \mathrm{H}, \mathrm{H}-18$ ).

2-phenylquinoline-4-carboxylate (79, DMA-P148). According to general procedure I, 19 (56.2 $\mathrm{mg}, 0.182 \mathrm{mmol})$ and $\mathbf{1 3}(54.5 \mathrm{mg}, 0.201 \mathrm{mmol})$ were converted to $79(36.5 \mathrm{mg}, 39 \%)$ as an orange solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\right.$ acetone $\left.-\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 11.19$ (br, $1 \mathrm{H}, \mathrm{H}-21$ ), 8.83 (d, $1 \mathrm{H}, \mathrm{J}=8.5 \mathrm{~Hz}$, H-14), 8.62 (s, 1 H, H-8), 8.36-8.34 (m, 2 H, H-1, H-5), 8.21 (d, $1 \mathrm{H}, J=8.4 \mathrm{~Hz}, \mathrm{H}-11$ ), 7.86 (t, $1 \mathrm{H}, J=6.9 \mathrm{~Hz}, \mathrm{H}-13), 7.69(\mathrm{t}, 1 \mathrm{H}, J=7.4 \mathrm{~Hz}, \mathrm{H}-12), 7.62-7.51(\mathrm{~m}, 3 \mathrm{H}, \mathrm{H}-2, \mathrm{H}-3, \mathrm{H}-4), 7.36-$
7.32 (m, 6 H, H-21, H-24, H-25, H-26, H-27, H-28), 5.69 ( $\mathrm{s}, 2 \mathrm{H}, \mathrm{H}-17$ ), 5.41 (s, $2 \mathrm{H}, \mathrm{H}-22$ ), 3.34 (s, $3 \mathrm{H}, \mathrm{H}-30$ ).

2-(6-Amino-1-benzyl-3-methyl-2,4-dioxo-1,2,3,4-tetrahydropyrimidin-5-yl)-2-oxoethyl 2,8-bis(trifluoromethyl)quinoline-4-carboxylate (80, DMA-P155). According to general
 ( $52.5 \mathrm{mg}, 58 \%$ ) as a tan solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 11.14$ (br, $1 \mathrm{H}, \mathrm{H}-17$ ), 9.22 (d, $1 \mathrm{H}, \mathrm{J}=8.8 \mathrm{~Hz}, \mathrm{H}-8), 8.51(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-3), 8.44(\mathrm{~d}, 1 \mathrm{H}, J=7.3 \mathrm{~Hz}, \mathrm{H}-6), 8.06(\mathrm{t}, 1 \mathrm{H}, J=7.9 \mathrm{~Hz}$, H-7), 7.49 (br, 1 H, H-17), 7.36-7.33 (m, 5 H, H-20, H-21, H-22, H-23, H-24), 5.71 (s, 2 H, H13), 5.41 (s, $2 \mathrm{H}, \mathrm{H}-18$ ), 3.34 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{H}-26$ ).

### 4.3 ADDITION OF ORGANOMETALLIC REAGENTS TO BENZOTHIAZOLE AND METHYLTHIADIAZOLE ALDIMINES

### 4.3.1 Synthesis of $\boldsymbol{N}$-Bts- and $\boldsymbol{N}$-Ths-benzaldimines

140

General procedure J. 5-Methyl-1,3,4-thiadiazole-2-sulfonyl chloride (140). ${ }^{56}$ To a solution of acetic acid ( $45.0 \mathrm{~mL}, 33 \%$ ) cooled to $-5-5{ }^{\circ} \mathrm{C}$ (internal thermometer) was introduced a vigorous stream of $\mathrm{Cl}_{2}$ gas. After 5 min , the solution became yellow and a yellow solid precipitated. At this time, 5-methyl-1,3,4-thiadiazole-2-thiol 143 ( $5.00 \mathrm{~g}, 37.8 \mathrm{mmol}$ ) was slowly added to the reaction mixture over a 30 min period, carefully keeping the temperature of the reaction mixture $<5{ }^{\circ} \mathrm{C}$ and the solution thoroughly saturated with $\mathrm{Cl}_{2}$ gas at all times. The reaction mixture was stirred for an additional 15 min after all of $\mathbf{1 4 3}$ was added. The resulting white precipitate which formed during the course of the reaction was quickly isolated by vacuum filtration through an ice cooled Buchner funnel and was washed with ice cold deionized water $(30.0 \mathrm{~mL})$. The solid was then dissolved in cold ether ( 125 mL ) and the ether solution was washed with a cold saturated $\mathrm{NaHCO}_{3}$ solution (1 X 75.0 mL ) followed by a cold saturated brine solution (1 X 50.0 mL ). The ether solution was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated by rotary evaporation ( $10{ }^{\circ} \mathrm{C}$ ), and the resulting white solid was recrystallized from ether ( 50.0 mL ) at -78 ${ }^{\circ} \mathrm{C}$, isolated by vacuum filtration and dried under high vacuum for 2 h . The product 140 ( 3.94 g , $53 \%$ ) was isolated as a white crystalline solid: $\mathrm{Mp} 48-49{ }^{\circ} \mathrm{C}(\mathrm{dec}) ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right)$ $\delta 2.97$ (s, 3 H$)$.

Benzo[d]thiazole-2-sulfonyl chloride (139). ${ }^{56}$ According to general procedure J , benzo[d]thiazole-2-thiol $142(4.00 \mathrm{~g}, 23.9 \mathrm{mmol})$ was slowly added over a 1.5 h period to a mixture of acetic acid ( $45 \mathrm{~mL}, 33 \%$ ) and $\mathrm{Cl}_{2}$ gas (large excess). The reaction mixture was stirred for an additional 30 min after all of $\mathbf{1 4 2}$ was added. A modified work up procedure was performed in which the crude reaction product was isolated by vacuum filtration, washed with ice cooled deionized water ( 40.0 mL ), dissolved in cold $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ and washed with a cold saturated $\mathrm{NaHCO}_{3}$ solution (1 X 50.0 mL ), followed by a cold saturated brine solution (1 X 50.0 mL ). The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution was then filtered through a 1 in plug of celite, concentrated by rotary evaporation $\left(13{ }^{\circ} \mathrm{C}\right)$ and the crude orange solid was recrystallized from ether ( 20.0 mL ) at $-78{ }^{\circ} \mathrm{C}$. The product 139 ( $3.24 \mathrm{~g}, 56 \%$ ) was isolated as a white crystalline solid: Mp 104.5-108 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.33(\mathrm{~d}, 1 \mathrm{H}, J=7.5 \mathrm{~Hz}), 8.08(\mathrm{~d}, 1 \mathrm{H}, J=6.9 \mathrm{~Hz}), 7.74-7.73$ (m, 2 H).

144

Benzo[d]thiazole-2-sulfonamide (144). ${ }^{76}$ To a solution of 139 ( $2.46 \mathrm{~g}, 10.5 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 25.0 mL ) cooled to $-78{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere, was added condensed $\mathrm{NH}_{3}$ (5 drops, acetone/dry ice condenser) over a 15 min period. The reaction mixture was then slowly warmed to room temperature. After 17 h , the heterogeneous reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and diluted with hexanes ( 25.0 mL ). The resulting white precipitate was isolated by vacuum filtration, washed with a $1: 1$ solution of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and hexanes, and added to a boiling solution of

EtOAc ( 100 mL ) with stirring for 20 min . After 20 min , the EtOAc solution was cooled to room temperature, filtered through a 1.5 in plug of $\mathrm{SiO}_{2}$ and concentrated by rotary evaporation. The resulting white solid was recrystallized from a $5: 1$ solution of hexanes and EtOAc. The recrystallized product was isolated by vacuum filtration, washed with hexanes ( 40 mL ) and dried under high vacuum for 10 h . The product 144 ( $1.64 \mathrm{~g}, 73 \%$ ) was isolated as a white crystalline solid: Mp 179-180 ${ }^{\circ} \mathrm{C}$, IR (KBr) 3312, 3151, 3039, 1472, 1356, 1164, 929, $765 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 8.33(\mathrm{~s}, 2 \mathrm{H}), 8.27(\mathrm{~d}, 1 \mathrm{H}, J=7.8 \mathrm{~Hz}), 8.17(\mathrm{~d}, 1 \mathrm{H}, J=8.1 \mathrm{~Hz}), 7.70-$ $7.60(\mathrm{~m}, 2 \mathrm{H}, \mathrm{J}=7.8 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 169.4,151.7,135.6,127.5,127.4$, 124.2, 123.2; MS (EI) m/z 214 ( $\mathrm{M}^{+}, 85$ ), 150 (100), 135 (94), 108 (80), 90 (74), 80 (58), 68 (88); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2}$ 213.9871, found 213.9874.

145

5-Methyl-1,3,4-thiadiazole-2-sulfonamide (145). ${ }^{77}$ To a solution of 140 ( $3.57 \mathrm{~g}, 18.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40.0 \mathrm{~mL})$ cooled to $-78{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere, was added condensed $\mathrm{NH}_{3}(7-8$ drops, acetone/dry ice condenser) over a 5 min period. The reaction mixture was then slowly warmed to room temperature. After 16 h , the heterogeneous reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and the white precipitate was isolated by vacuum filtration. The solid was stirred in boiling EtOAc ( 100 mL ) for 20 min to dissolve the sulfonamide. The resulting heterogeneous mixture was cooled to room temperature and the remaining ammonium salts were removed by vacuum filtration. The EtOAc solution was concentrated by rotary evaporation and the resulting white solid was recrystallized from a 1:1 solution of EtOAc and hexanes. The precipitate was isolated
by vacuum filtration, washed with hexanes ( 40.0 mL ) and dried under high vacuum for 2 h . The product 145 ( 2.20 g , $68 \%$ ) was isolated as a white crystalline solid: Mp $164.5-166{ }^{\circ} \mathrm{C}$; IR ( KBr ) 3319, 3148, 3035, 1418, 1358, 1209, 1175, $930 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (acetone- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 7.59(\mathrm{~s}$, 2 H ), 2.85 (s, 3 H ); ${ }^{13} \mathrm{C}-$ NMR (acetone- $\left.\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta 171.3,170.5,15.7$; MS (EI) m/z $179\left(\mathrm{M}^{+}\right.$, 17), 115 (100), 99 (71), 80 (25), 59 (15); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2}$ 178.9823, found 178.9831.

(E)-N-Benzylidenebenzo[d]thiazole-2-sulfonamide (146). To a suspension of 144 (500 mg, 2.33 mmol ) and $p$ - $\mathrm{TsOH}(22.3 \mathrm{mg}, 0.117 \mathrm{mmol})$ in toluene ( 20.0 mL ) was added freshly distilled benzaldehyde 110 ( $0.237 \mathrm{~mL}, 2.33 \mathrm{mmol}$ ). The reaction mixture was heated at reflux under a nitrogen atmosphere for 20 h . Water formed during the course of the reaction was azeotropically removed via a Dean-Stark trap. After 20 h , the reaction mixture was cooled to room temperature and filtered through a flame-dried piece of glass wool contained inside a disposable 9 in pipette. The toluene was removed in vacuo and the resulting crude yellow oil was recrystallized from a 7:1 mixture of hexanes to EtOAc. The precipitate was isolated by vacuum filtration, washed with hexanes ( 30.0 mL ) and dried under high vacuum for 15 h . The product 146 ( $614 \mathrm{mg}, 87 \%$ ) was isolated as an off-white crystalline solid: Mp 128-129 ${ }^{\circ} \mathrm{C}$ (dec); IR (KBr) 3067, 1596, 1566, 1313, 1338, 1161, 870, $769 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 9.24(\mathrm{~s}, 1 \mathrm{H}), 8.20(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=$ $7.7 \mathrm{~Hz}), 8.06-8.01(\mathrm{~m}, 3 \mathrm{H}), 7.76-7.60(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 175.5,164.2$, ( $\mathrm{M}^{+}, 1.7$ ), 237 (5), 214 (12), 150 (18), 135 (100), 105 (33); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2}$ 302.0184, found 302.0180.

147

Representative procedure for the synthesis of ( $E$ )- $N$-benzylidene-5-methyl-1,3,4-thiadiazole-2-sulfonamide stock solutions (147). To a suspension of 145 ( $179 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) and PTSA ( $9.50 \mathrm{mg}, 0.0500 \mathrm{mmol}$ ) in toluene $(8.0 \mathrm{~mL})$ was added freshly distilled benzaldehyde 110 ( $0.102 \mathrm{~mL}, 1.00 \mathrm{mmol}$ ). The reaction mixture was heated at reflux under a nitrogen atmosphere. Water formed during the course of the reaction was azeotropically removed via a Dean-Stark trap. After 21 h , the reaction mixture was cooled to room temperature and filtered through a flame dried piece of glass wool, contained inside a disposable 9 in pipette, into a dry 5.0 mL volumetric flask. The resulting solution was immediately sealed with a septum under nitrogen gas and then diluted to the 5.0 mL mark with dry toluene. An aliquot ( $0.500 \mathrm{~mL}, 0.100$ mmol) of the aldimine stock solution was removed and added to a dry NMR tube containing a $98 \%$ pure sample of 2,3-dimethoxybenzladehyde ( $17.5 \mathrm{mg}, 0.103 \mathrm{mmol}$ ) dissolved in dry $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.50 \mathrm{~mL})$. The 2,3-dimethoxybenzaldehyde served as an internal standard for ${ }^{1} \mathrm{H}$-NMR ( 300 MHz , pulse delay $=10.00 \mathrm{~s}$ ) integration. Integration of the Ths-benzaldimine proton ( $\delta$ 9.54, area $=1.00$ ) versus the internal standard aldehyde proton ( $\delta 10.84$, area $=1.31$ ) showed the reaction yield to be 79\%.

### 4.3.2 Organometallic additions to N -Bts- and N -Ths-benzaldimines

5-Methyl- $N$-(1-phenylethyl)-1,3,4-thiadiazole-2-sulfonamide (148) by reaction of 147 with MeLi. To a solution of $\operatorname{MeLi}(0.36 \mathrm{~mL}, 0.40 \mathrm{mmol}, 1.1 \mathrm{M})$ in THF $(1.50 \mathrm{~mL})$ was added a solution of $147(1.00 \mathrm{~mL}, 0.160 \mathrm{mmol}, 0.160 \mathrm{M})$ at $-78{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere. The reddish-brown reaction mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 2 h , was quenched by the addition of a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5.0 mL ) and was warmed to room temperature. After stirring for 10 min, the quenched reaction mixture was partitioned between a saturated brine solution ( 10.0 mL ) and ether ( 10.0 mL ). The ether layer was removed and the aqueous layer was extracted with ether ( 2 X 10.0 mL ). The ether layers were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting crude residue was chromatographed on $\mathrm{SiO}_{2}$ (1:1 EtOAc: hexanes). The product was recrystallized from EtOAc and hexanes, isolated by vacuum filtration, washed with hexanes ( 15.0 mL ) and dried under high vacuum for 1 h to give 148 (10.4 $\mathrm{mg}, 23 \%$ ) as a white crystalline solid: Mp 130-131 ${ }^{\circ} \mathrm{C}$; $\mathrm{IR}(\mathrm{KBr}) 3065,2981,2866,1468,1447$, 1350, 1208, 1169, 1095, 1016, $768 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.27-7.21(\mathrm{~m}, 5 \mathrm{H})$, $5.85(\mathrm{~s}, 1 \mathrm{H}), 4.74(\mathrm{q}, 1 \mathrm{H}, J=6.9 \mathrm{~Hz}), 2.75(\mathrm{~s}, 3 \mathrm{H}), 1.55(\mathrm{~d}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 170.9,169.7,142.1,128.9$ (2), 127.9, 126.9 (2), 55.3, 23.4, 15.8; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 306.0347, found 306.0328.

151

General procedure K. Grignard reactions. 5-Methyl-N-(2-methyl-1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (151, Table 3 entry 2). To a solution of 147 ( $0.385 \mathrm{~mL}, 0.237$ mmol, 0.615 M ) in THF ( 2.00 mL ) cooled to $-78{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere, was added a solution of $i-\mathrm{PrMgCl}$ in ether $(0.30 \mathrm{~mL}, 0.60 \mathrm{mmol}, 2.0 \mathrm{M})$. The resulting red-orange solution was stirred at $-78{ }^{\circ} \mathrm{C}$ for 2 h and then quenched with a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5.0 mL ). After stirring for 10 min , the quenched reaction mixture was partitioned between a saturated brine solution $(10.0 \mathrm{~mL})$ and ether $(10.0 \mathrm{~mL})$. The ether layer was removed and the aqueous layer was extracted with ether ( 2 X 10.0 mL ). The ether layers were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting crude residue was chromatographed on $\mathrm{SiO}_{2}$ (1:1 EtOAc: hexanes). The isolated product was recrystallized from a $1: 10$ mixture of EtOAc and hexanes, washed with hexanes $(15.0 \mathrm{~mL})$ and dried under high vacuum for 1 h to give 151 (43.5 mg, 59\%) as a white crystalline solid: Mp $164-165^{\circ} \mathrm{C}$; IR ( KBr ) 3118, 2975, 2870, 1452, 1352, 1097, 1051, 922, $705 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.20-7.18(\mathrm{~m}, 3 \mathrm{H}), 7.07-7.04$ $(\mathrm{m}, 2 \mathrm{H}), 5.90(\mathrm{~d}, 1 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.24(\mathrm{t}, 1 \mathrm{H}, J=8.3 \mathrm{~Hz}), 2.67(\mathrm{~s}, 3 \mathrm{H}), 2.01(\mathrm{~m}, 1 \mathrm{H}, J=6.8$ $\mathrm{Hz}), 1.03(\mathrm{~d}, 3 \mathrm{H}, J=6.6 \mathrm{~Hz}), 0.76(\mathrm{~d}, 3 \mathrm{H}, J=6.6 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR} \delta 170.1,169.6,140.0,128.6$ (2), 127.9 (2), 127.6, 65.9, 34.4, 19.6, 19.4, 15.8; HRMS (TOF MS EI+) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2}(\mathrm{M}+\mathrm{H}) 312.0840$, found 312.0835.

## 5-Methyl- $N$-(2-methyl-1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (151, Talbe 3 entry

1). According to general procedure K , a solution of $147(0.385 \mathrm{~mL}, 0.237 \mathrm{mmol}, 0.615 \mathrm{M})$ and
$i-\mathrm{PrMgCl}$ in THF $(0.30 \mathrm{~mL}, 0.60 \mathrm{mmol}, 2.0 \mathrm{M})$ were reacted in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.00 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ for 2.5 h . The same workup procedure was followed except $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was used in place of ether. The product 151 ( $41.9 \mathrm{mg}, 57 \%$ ) was isolated as a white crystalline solid.

5-Methyl- $N$-(2-methyl-1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (151, Table 3 entry
3). According to general procedure K , a solution of $147(0.358 \mathrm{~mL}, 0.237 \mathrm{mmol}, 0.666 \mathrm{M})$ and $i-\mathrm{PrMgCl}$ in THF ( $0.30 \mathrm{~mL}, 0.60 \mathrm{mmol}, 2.0 \mathrm{M}$ ) were reacted in THF ( 2.00 mL ) initially at -78 ${ }^{\circ} \mathrm{C}$. The reaction mixture was warmed to room temperature for 1.5 h following the addition of $i$ PrMgCl. The product 151 ( $13.9 \mathrm{mg}, 19 \%$ ) was isolated as a white crystalline solid.

## 5-Methyl-N-(2-methyl-1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (151, Table 3 entry

4). According to general procedure K , a solution of $147(0.358 \mathrm{~mL}, 0.316 \mathrm{mmol}, 0.883 \mathrm{M})$ and $i-\mathrm{PrMgBr}$ in THF $(0.40 \mathrm{~mL}, 0.80 \mathrm{mmol}, 2.0 \mathrm{M})$ were reacted in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.00 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ for 2.5 h . The same workup procedure was followed except $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was used in place of ether. The product 151 was isolated as a white crystalline solid ( $60.2 \mathrm{mg}, 61 \%$ ).

5-Methyl- $N$-(1-phenylethyl)-1,3,4-thiadiazole-2-sulfonamide (148, Table 3 entry 5). According to general procedure K , a solution of $147(1.00 \mathrm{~mL}, 0.160 \mathrm{mmol}, 0.160 \mathrm{M})$ and MeMgBr in ether ( $0.13 \mathrm{~mL}, 0.40 \mathrm{mmol}, 3.0 \mathrm{M}$ ) were reacted in THF ( 2.00 mL ) at $-78{ }^{\circ} \mathrm{C}$ for 2 h . The resulting product 148 ( $27.7 \mathrm{mg}, 61 \%$ ) was isolated as a white crystalline solid.

5-Methyl- $N$-(1-phenylallyl)-1,3,4-thiadiazole-2-sulfonamide (152, Table 3 entry 6). According to general procedure K , a solution of $147(1.00 \mathrm{~mL}, 0.160 \mathrm{mmol}, 0.160 \mathrm{M})$ and vinyl MgBr in THF ( $0.40 \mathrm{~mL}, 0.40 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were reacted in THF $(1.50 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ for 2 h. The resulting product 152 ( $21.8 \mathrm{mg}, 46 \%$ ) was isolated as a white crystalline solid: Mp 122$123{ }^{\circ} \mathrm{C}$; IR (KBr) 3141, 3024, 2870, 1443, 1360, 1172, 1054, 939, $702 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right.$, $300 \mathrm{MHz}) \delta$ 7.32-7.21 (m, 5 H ), 6.05-5.94 (m, 1 H), 5.86 (d, 1 H J = 7.2 Hz), 5.23-5.17 (m, 3 H ), 2.77 (s, 3 H ); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 170.2,169.0,139.0,136.7,129.1$ (2), 128.5, 127.7 (2), 117.8, 61.1, 16.0; HRMS (TOF MS ES + ) $m / z$ calculated for $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2}(\mathrm{M}+\mathrm{H})$ 296.0527, found 296.0506.

5-Methyl- $N$-(1-phenylbut-2-ynyl)-1,3,4-thiadiazole-2-sulfonamide (153, Table 3 entry 7). According to general procedure K , a solution of $147(1.00 \mathrm{~mL}, 0.160 \mathrm{mmol}, 0.160 \mathrm{M})$ and 1propynylMgBr in THF ( $0.80 \mathrm{~mL}, 0.40 \mathrm{mmol}, 0.50 \mathrm{M}$ ) were reacted in THF $(1.50 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ for 2 h . The resulting product 153 ( $23.9 \mathrm{mg}, 49 \%$ ) was isolated as a white crystalline solid: Mp $169-170{ }^{\circ} \mathrm{C}$; IR (KBr) 3055, 2858, 1455, 1351, 1211, 1173, 1019, $734 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right.$, $300 \mathrm{MHz}) \delta 7.50-7.46(\mathrm{~m}, 2 \mathrm{H}), 7.39-7.33(\mathrm{~m}, 3 \mathrm{H}), 5.67(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}), 5.43$ (dd, $1 \mathrm{H}, \mathrm{J}=$
6.6, 2.1 Hz ), $2.84(\mathrm{~s}, 3 \mathrm{H}), 1.72(\mathrm{~d}, 3 \mathrm{H}, J=2.4 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 170.5$, 168.8, 137.8, 129.3 (2), 129.2, 128.0 (2), 84.7, 75.5, 51.0, 16.2, 3.7; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na}) 330.0347$, found 330.0345 .

$N$-Benzhydryl-5-methyl-1,3,4-thiadiazole-2-sulfonamide (154, Table 3 entry 8). According to general procedure K , a solution of $147(1.00 \mathrm{~mL}, 0.160 \mathrm{mmol}, 0.160 \mathrm{M})$ and PhMgBr in ether ( $0.13 \mathrm{~mL}, 0.40 \mathrm{mmol}, 3.0 \mathrm{M}$ ) were reacted in THF ( 1.50 mL ) at $-78^{\circ} \mathrm{C}$ for 2 h . The resulting product 154 ( 35.2 mg , 64\%) was isolated as a white crystalline solid: Mp $185-186{ }^{\circ} \mathrm{C}$; $\mathrm{IR}(\mathrm{KBr})$ 3174, 3066, 2869, 1447, 1359, 1174, 1045, $702 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.33-7.21$ $(\mathrm{m}, 10 \mathrm{H}), 6.08(\mathrm{~d}, 1 \mathrm{H}, J=6.9 \mathrm{~Hz}), 5.85(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=7.5 \mathrm{~Hz}), 2.73(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right.$, 300 MHz ) $\delta 170.3,168.8,140.1$ (2), 129.1 (4), 128.3 (2), 127.8 (4), 62.5, 15.9; HRMS (TOF MS ES + ) $m / z$ calculated for $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2}(\mathrm{M}+\mathrm{H})$ 346.0684, found 346.0671.

$N$-(1-Phenylethyl)benzo[d]thiazole-2-sulfonamide (155, Table 4 entry 1). According to general procedure $\mathrm{K}, 146(90.7 \mathrm{mg}, 0.300 \mathrm{mmol})$ and MeMgBr in ether ( $0.20 \mathrm{~mL}, 0.60 \mathrm{mmol}$, 3.0 M ) were reacted in THF ( 1.80 mL ) at $-78{ }^{\circ} \mathrm{C}$ for 2.5 h . The same workup procedure was
performed except that the product was isolated by chromatography on $\mathrm{SiO}_{2}$ (3:1 hexanes: EtOAc). The product 155 ( $83.2 \mathrm{mg}, 87 \%$ ) was isolated as a white crystalline solid: Mp 144-145 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3116, 2973, 2874, 1477, 1350, 1163, 1062, 982, $764 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300\right.$ $\mathrm{MHz}) \delta 8.07(\mathrm{dd}, 1 \mathrm{H}, J=8.0,1.5 \mathrm{~Hz}), 7.92(\mathrm{dd}, 1 \mathrm{H}, J=8.1,1.2 \mathrm{~Hz}), 7.57(\mathrm{dt}, 2 \mathrm{H}, J=7.4,1.2$ Hz ), $7.24(\mathrm{~d}, 2 \mathrm{H}, J=6.9 \mathrm{~Hz}), 7.15-7.04(\mathrm{~m}, 3 \mathrm{H}), 6.35(\mathrm{~d}, 1 \mathrm{H}, J=7.2 \mathrm{~Hz}), 4.80$ (quintet, $1 \mathrm{H}, J$ $=7.1 \mathrm{~Hz}), 1.53(\mathrm{~d}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 167.3,152.8,142.2,137.0$, 128.9 (2), 128.1, 128.0, 127.8, 126.9 (2), 125.3, 122.6, 55.3, 23.7; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na}) 341.0394$, found 341.0389.

$N$-(2-Methyl-1-phenylpropyl)benzo[d]thiazole-2-sulfonamide (156, Table 4 entry 2). According to general procedure $\mathrm{K}, \mathbf{1 4 6}(90.7 \mathrm{mg}, 0.300 \mathrm{mmol})$ and $i$ - PrMgCl in ether $(0.30 \mathrm{~mL}$, $0.60 \mathrm{mmol}, 2.0 \mathrm{M})$ were reacted in THF ( 1.70 mL ) at $-78{ }^{\circ} \mathrm{C}$ for 2.5 h . The same workup procedure was performed except that the product was isolated by chromatography on $\mathrm{SiO}_{2}$ (3:1 hexanes: EtOAc) to give 156 ( $90.1 \mathrm{mg}, 87 \%$ ) as a white crystalline solid: $\mathrm{Mp} 157-158{ }^{\circ} \mathrm{C}$; IR (KBr) 3265, 2959, 2872, 1455, 1336, 1041, 915, $771 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.99$ (dd, $1 \mathrm{H}, J=8.1,1.2 \mathrm{~Hz}$ ), 7.87 (dd, $1 \mathrm{H}, J=7.8,1.2 \mathrm{~Hz}$ ), $7.53(\mathrm{dt}, 2 \mathrm{H}, J=7.2,1.2 \mathrm{~Hz}), 7.02-$ 6.93 (m, 5 H), $5.58(\mathrm{~d}, 1 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.26(\mathrm{t}, 1 \mathrm{H}, J=8.1 \mathrm{~Hz}), 2.01(\mathrm{~m}, 1 \mathrm{H}, J=6.9 \mathrm{~Hz}), 1.00$ $(\mathrm{d}, 3 \mathrm{H}, J=6.6 \mathrm{~Hz}), 0.75(\mathrm{~d}, 3 \mathrm{H}, J=6.6 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 166.7,152.8$,

$N$-(1-Phenylallyl)benzo[d]thiazole-2-sulfonamide (157, Table 4 entry 3). According to general procedure $\mathrm{K}, 146(90.7 \mathrm{mg}, 0.300 \mathrm{mmol})$ and vinyl MgBr in THF ( $0.60 \mathrm{~mL}, 0.60 \mathrm{mmol}$, $1.0 \mathrm{M})$ were reacted in THF ( 1.20 mL ) at $-78{ }^{\circ} \mathrm{C}$ for 3 h . The same workup procedure was performed except that the product was isolated by chromatography on $\mathrm{SiO}_{2}$ ( $3: 1$ hexanes: EtOAc) to give 157 ( $84.5 \mathrm{mg}, 85 \%$ ) as a white crystalline solid: Mp 141-142 ${ }^{\circ} \mathrm{C}$; IR ( KBr ) 3117, 2872, 1450, 1346, 1161, 1039, 930, $765 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.07(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=$ 8.1 Hz), $7.90(\mathrm{~d}, 1 \mathrm{H}, J=7.2 \mathrm{~Hz})$, $7.54(\mathrm{dt}, 2 \mathrm{H}, J=7.2,1.5 \mathrm{~Hz}), 7.16-7.12(\mathrm{~m}, 5 \mathrm{H}), 5.93$ (m, 1 H), $5.52(\mathrm{~s}, 1 \mathrm{H}), 5.27-5.12(\mathrm{~m}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 167.1,152.9,139.5,137.2$, 137.0, 129.1 (2), 128.5, 128.1, 127.9 (3), 125.4, 122.7, 117.8, 61.4; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2}(\mathrm{M}+\mathrm{H})$ 331.0575, found 331.0549.

$N$-(1-Phenylbut-2-ynyl)benzo[d]thiazole-2-sulfonamide (158, Table 4 entry 4). According to general procedure $\mathrm{K}, 146$ ( $90.7 \mathrm{mg}, 0.300 \mathrm{mmol}$ ) and 1-propynylMgBr in THF (1.2 mL, 0.60 mmol, 0.50 M ) were reacted in THF ( 1.30 mL ) at $-78^{\circ} \mathrm{C}$ for 3 h . The same workup procedure was performed except that the product was isolated by chromatography on $\mathrm{SiO}_{2}$ (3:1 hexanes: EtOAc) to give 158 (72.8 mg, 71\%) as a white crystalline solid: Mp 155.5-156.5 ${ }^{\circ} \mathrm{C}$; IR ( KBr ) 3073, 2866, 1454, 1351, 1168, 1038, $764 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 8.14(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=$ $7.2 \mathrm{~Hz}), 8.00(\mathrm{~d}, 1 \mathrm{H}, J=7.5 \mathrm{~Hz}), 7.61-7.55(\mathrm{~m}, 2 \mathrm{H}), 7.48(\mathrm{~d}, 2 \mathrm{H}, J=6.6 \mathrm{~Hz}), 7.28-7.25(\mathrm{~m}, 3$ H), $6.18(\mathrm{~s}, 1 \mathrm{H}), 5.46(\mathrm{~s}, 1 \mathrm{H}), 1.29(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 166.6,153.2,138.0$, 137.3, 129.2 (2), 129.1, 128.3, 128.0 (3), 125.5, 122.8, $84.5,75.3,51.0,3.3$; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{17} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 365.0394, found 365.0358.

$N$-Benzhydrylbenzo[d]thiazole-2-sulfonamide (159, Table 4 entry 5). According to general procedure K, 146 ( $90.7 \mathrm{mg}, 0.300 \mathrm{mmol}$ ) and PhMgBr in ether ( $0.20 \mathrm{~mL}, 0.60 \mathrm{mmol}, 3.0 \mathrm{M}$ ) were reacted in THF ( 1.80 mL ) at $-78^{\circ} \mathrm{C}$ for 3 h . The same workup procedure was performed except that the product was isolated by chromatography on $\mathrm{SiO}_{2}$ ( $3: 1$ hexanes: EtOAc). The product was recrystallized from a 5:1 mixture of hexanes and EtOAc to afford 159 ( 88.4 mg ,
$77 \%$ ) as a white crystalline solid: $\mathrm{Mp} 187-188{ }^{\circ} \mathrm{C} ; \mathrm{KBr}(\mathrm{IR}) 3156,3068,1448,1350,1167,1045$, $945 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 8.06(\mathrm{dd}, 1 \mathrm{H}, J=8.4,1.2 \mathrm{~Hz}), 7.93(\mathrm{dd}, 1 \mathrm{H}, J=8.1$, 1.2 Hz), $7.58(\mathrm{dt}, 2 \mathrm{H}, J=7.5,1.2 \mathrm{~Hz}), 7.19-7.15(\mathrm{~m}, 10 \mathrm{H}), 5.87(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right.$, 300 MHz ) $\delta 166.3,152.4,139.9$ (2), 136.7, 128.7 (4), 128.0 (2), 127.7 (5), 127.4, 125.2, 122.1, 62.3; HRMS (TOF MS ES+) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{20} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na}$ ) 403.0551, found 403.0520 .

General procedure L. Diethylzinc Reactions. 5-Methyl-N-(1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (160, Table 5 entry 2). To a solution of 147 ( $2.00 \mathrm{~mL}, 0.312 \mathrm{mmol}$, $0.156 \mathrm{M})$ in toluene ( 2.50 mL ) was slowly added a solution of $\mathrm{Et}_{2} \mathrm{Zn}$ in toluene ( $0.48 \mathrm{~mL}, 0.48$ $\mathrm{mmol}, 1.0 \mathrm{M}$ ). The resulting dark red-orange reaction mixture was stirred at room temperature for 2.5 h and quenched with a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5.0 mL ). After stirring for 10 min , the quenched mixture was partitioned between a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 10.0 mL ) and ether (20.0 mL ). The aqueous layer was extracted with ether ( 2 X 20.0 mL ). The combined ether layers were washed with a saturated brine solution $(5.0 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting crude residue was chromatographed on $\mathrm{SiO}_{2}$ (1:1 EtOAc: hexanes). The product was recrystallized from a 1:10 mixture of EtOAc and hexanes, isolated by vacuum filtration, washed with hexanes ( 15.0 mL ) and dried under high vacuum for 1 h to give 160 (48.8 mg, 53\%) as a white crystalline solid: Mp 144-145 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3105, 2941, 2864, 1458, 1350,

1167, 1100, 1011, 913, $760 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.23-7.13(\mathrm{~m}, 5 \mathrm{H}), 6.23(\mathrm{~d}, 1$ $\mathrm{H}, J=7.2 \mathrm{~Hz}), 4.45(\mathrm{q}, 1 \mathrm{H}, J=7.4 \mathrm{~Hz}), 2.70(\mathrm{~s}, 3 \mathrm{H}), 2.01-1.72(\mathrm{~m}, 2 \mathrm{H}, J=7.3 \mathrm{~Hz}), 0.85(\mathrm{t}, 3$ $\mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 170.3,169.8,140.9,129.1$ (2), 128.1, 127.7 (2), 61.6, 30.8, 16.0, 10.9; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{12} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na}$ ) 320.0503, found 320.0493.

5-Methyl- $N$-(1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (160, Table 5 entry 1). According to general procedure L, a solution of 147 in THF ( $2.00 \mathrm{~mL}, 0.312 \mathrm{mmol}, 0.156 \mathrm{M}$ ) and a solution of $\mathrm{Et}_{2} \mathrm{Zn}$ in toluene ( $0.48 \mathrm{~mL}, 0.48 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were reacted in THF ( 2.00 mL ) at room temperature for 4 h . The product $\mathbf{1 6 0}(39.9 \mathrm{mg}, 43 \%)$ was isolated as a white crystalline solid.

5-Methyl- $N$-(1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (160, Table 5 entry 3). According to general procedure L , a solution of 147 in toluene ( $2.00 \mathrm{~mL}, 0.316 \mathrm{mmol}, 0.158 \mathrm{M}$ ) and a solution of $\mathrm{Et}_{2} \mathrm{Zn}$ in toluene ( $0.80 \mathrm{~mL}, 0.80 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were reacted in toluene ( 2.80 mL ) at room temperature for 2.5 h . The product $\mathbf{1 6 0}$ ( $65.7 \mathrm{mg}, 70 \%$ ) was isolated as a white crystalline solid.

## 5-Methyl- $N$-(1-phenylpropyl)-1,3,4-thiadiazole-2-sulfonamide (160, Table 5 entry 4).

 According to general procedure L , a solution of 147 in toluene ( $1.00 \mathrm{~mL}, 0.158 \mathrm{mmol}, 0.158 \mathrm{M}$ ) and a solution of $\mathrm{Et}_{2} \mathrm{Zn}$ in toluene ( $0.20 \mathrm{~mL}, 0.20 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were reacted in toluene ( 2.20 mL ) at $-78{ }^{\circ} \mathrm{C}$ for 33 h . The product $\mathbf{1 6 0}$ ( $28.6 \mathrm{mg}, 61 \%$ ) was isolated as a white crystalline solid.161

$N$-(1-Phenylpropyl)benzo[d]thiazole-2-sulfonamide (161, Table 5 entry 5). According to general procedure $\mathrm{L}, 146(90.7 \mathrm{mg}, 0.300 \mathrm{mmol})$ and a solution of $\mathrm{Et}_{2} \mathrm{Zn}$ in toluene $(0.60 \mathrm{~mL}$, $0.60 \mathrm{mmol}, 1.0 \mathrm{M})$ were reacted in THF ( 1.40 mL ) at room temperature for 4 h . The same workup procedure was followed except the crude reaction mixture was chromatographed on $\mathrm{SiO}_{2}$ (3:1, hexanes: EtOAc). The product was recrystallized from a $5: 1$ mixture of hexanes and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to afford 161 (39.6 mg, 40\%) as a white crystalline solid: Mp 126.5-127.5 ${ }^{\circ} \mathrm{C}$; $\mathrm{IR}(\mathrm{KBr})$ 3171, 2967, 2873, 1456, 1357, 1163, 1037, $766 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.00(\mathrm{~d}, 1$ $\mathrm{H}, J=7.4 \mathrm{~Hz}), 7.82(\mathrm{~d}, 1 \mathrm{H}, J=7.2 \mathrm{~Hz}), 7.50(\mathrm{dt}, 2 \mathrm{H}, J=7.6,1.8 \mathrm{~Hz}), 7.09-6.95(\mathrm{~m}, 5 \mathrm{H}), 5.97$ (s, 1 H$), 4.48(\mathrm{~d}, 1 \mathrm{H}, J=4.2 \mathrm{~Hz}), 1.97-1.73(\mathrm{~m}, 2 \mathrm{H}, J=7.5 \mathrm{~Hz}), 0.81(\mathrm{t}, 3 \mathrm{H}, J=7.5 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-$ NMR $\delta$ 166.6, 152.1, 139.8, 136.4, 128.2 (2), 127.4, 127.3, 127.1, 126.7 (2), 124.8, 121.9, 60.8, 30.3, 10.5; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na}$ ) 355.0551, found 355.0557.
$N$-(1-Phenylpropyl)benzo[d]thiazole-2-sulfonamide (161, Table 5 entry 6). According to general procedure $\mathrm{L}, 146(90.7 \mathrm{mg}, 0.300 \mathrm{mmol})$ and a solution of $\mathrm{Et}_{2} \mathrm{Zn}$ in toluene $(0.60 \mathrm{~mL}$, $0.60 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were reacted in toluene $(1.40 \mathrm{~mL})$ at room temperature for 4 h . The same workup procedure was followed except that the crude reaction mixture was chromatographed on $\mathrm{SiO}_{2}$ (3:1, hexanes: EtOAc ). The product was recrystallized from a $5: 1$ mixture of hexanes and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to afford $\mathbf{1 6 1}(57.8 \mathrm{mg}, 58 \%)$ as a white crystalline solid.

Preparation of zirconocene hydrochloride from $\mathrm{LiAlH}_{4}(\mathbf{1 2 0}) .{ }^{58}$ To a solution of $\mathrm{Cp}_{2} \mathrm{ZrCl}_{2}$ ( $5.00 \mathrm{~g}, 17.1 \mathrm{mmol}$ ) in THF ( 45.0 mL ) under a nitrogen atmosphere was added a solution of $\mathrm{LiAlH}_{4}$ in ether ( 4.4 mL , $4.4 \mathrm{mmol}, 1.0 \mathrm{M}$ ) slowly via a syringe pump over a 45 min period. The reaction mixture was stirred for an additional 30 min . The resulting heterogeneous solution was filtered through a Schlenk filter under vacuum and the resulting solid was sequentially washed with THF (4 X 10 mL ), $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{X} 10 \mathrm{~mL}$ ), THF (1 X 10 mL ) and ether ( 1 X 5.0 mL ). The product was then dried under high vacuum in the dark for 15 h to yield $\mathbf{1 2 0}(3.16 \mathrm{~g}, \mathbf{7 2 \%}$ ) as a white solid.

General procedure M. Addition of alkenylzinc reagents. (E)-5-Methyl- $N$-(1-phenylhept-2-enyl)-1,3,4-thiadiazole-2-sulfonamide (163, Table 6 entry 1). To a suspension of $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}$ ( $163.8 \mathrm{mg}, 0.636 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.00 \mathrm{~mL})$ under a nitrogen atmosphere was added 1-hexyne ( $0.0820 \mathrm{~mL}, 0.720 \mathrm{mmol}$ ) at room temperature. After 15 min , the resulting clear pale yellow solution was cooled to $-78{ }^{\circ} \mathrm{C}$ and a $\mathrm{Me}_{2} \mathrm{Zn}$ solution in toluene ( $0.30 \mathrm{~mL}, 0.60 \mathrm{mmol}, 2.0 \mathrm{M}$ ) was added. This mixture was warmed to room temperature for 1 h and then slowly added to a solution of 147 in toluene ( $2.00 \mathrm{~mL}, 0.316 \mathrm{mmol}, 0.158 \mathrm{M}$ ). The resulting dark red-orange reaction mixture was stirred at room temperature for 2.5 h and then quenched by the addition of a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5.0 mL ). After stirring for 1 h , the quenched mixture was partitioned between a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 10.0 mL ) and ether ( 20.0 mL ). The aqueous layer was
extracted with ether ( 2 X 20.0 mL ). The ether layers were combined, washed with a saturated brine solution ( 5.0 mL ), filtered through a 1 in pad of $\mathrm{SiO}_{2}$ which was washed with additional EtOAc ( 20.0 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting crude residue was chromatographed on $\mathrm{SiO}_{2}$ (1:2 EtOAc: hexanes). The product was recrystallized from a 5:1 mixture of hexanes and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, isolated by vacuum filtration, washed with hexanes ( 15.0 mL ) and dried under high vacuum for 10 h to give 163 ( $38.4 \mathrm{mg}, 35 \%$ ) as a white crystalline solid: Mp 88.5-90 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3106, 2956, 2927, 2871, 1453, 1354, 1172, 1085, 979 $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.33-7.21(\mathrm{~m}, 5 \mathrm{H}), 6.30(\mathrm{~d}, 1 \mathrm{H}, J=7.8 \mathrm{~Hz}), 5.58(\mathrm{~m}, 2$ H), 5.15 (dt, $1 \mathrm{H}, J=6.3,2.7 \mathrm{~Hz}$ ), 2.75 (s, 3 H ), 1.95 (m, 2 H ), 1.26 (septet, $4 \mathrm{H}, J=3.6 \mathrm{~Hz}$ ), $0.86(\mathrm{t}, 3 \mathrm{H}, J=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 170.3,169.6,140.2,135.5,129.2$ (2), 128.5, 128.3, 127.8 (2), 61.2, 32.3, 31.5, 22.7, 16.1, 14.2; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 374.0937, found 374.0964.

## (E)-5-Methyl- N -(1-phenylhept-2-enyl)-1,3,4-thiadiazole-2-sulfonamide (163, Table 6 entry

2). According to general procedure $\mathrm{M}, \mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(163.8 \mathrm{mg}, 0.636 \mathrm{mmol})$, 1-hexyne ( 0.0820 $\mathrm{mL}, 0.720 \mathrm{mmol}), \mathrm{Me}_{2} \mathrm{Zn}(0.30 \mathrm{~mL}, 0.60 \mathrm{mmol}, 2.0 \mathrm{M})$ and a solution of 147 in toluene ( 2.00 $\mathrm{mL}, 0.320 \mathrm{mmol}, 0.160 \mathrm{M})$ were combined in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.00 \mathrm{~mL})$ for 10 h . The same workup procedure was performed except that the crude reaction mixture was chromatographed on $\mathrm{SiO}_{2}$ (3:1 hexanes: EtOAc) to give 163 ( $64.4 \mathrm{mg}, 57 \%$ ) as a white crystalline solid.

(E)-N-(1-Phenylhept-2-enyl)benzo[d]thiazole-2-sulfonamide (164, Table 6 entry 3). According to general procedure $\mathrm{M}, \mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(123.0 \mathrm{mg}, 0.477 \mathrm{mmol})$, 1-hexyne ( 0.0620 mL , $0.540 \mathrm{mmol}), \mathrm{Me}_{2} \mathrm{Zn}(0.225 \mathrm{~mL}, 0.450 \mathrm{mmol}, 2.0 \mathrm{M})$, and $146(90.7 \mathrm{mg}, 0.300 \mathrm{mmol})$ were combined in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.50 \mathrm{~mL})$ for 4.5 h . The same workup procedure was performed except that the crude reaction mixture was chromatographed on $\mathrm{SiO}_{2}$ (4:1 hexanes: EtOAc). The methyl addition product 146 ( $12.0 \mathrm{mg}, 13 \%$ ) was isolated as a white solid. The desired product 164 (82.3 mg, 71\%) was isolated as a white crystalline solid: Mp 98.5-99.5 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3131, 2923, 2872, 1452, 1351, 1168, 1036, 986, $756 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.11(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=$ 7.8 Hz ), $7.92(\mathrm{~d}, 1 \mathrm{H}, J=7.5 \mathrm{~Hz}$ ), 7.57 (quintet, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), $7.27-7.14(\mathrm{~m}, 5 \mathrm{H}), 5.60-5.50$ (m, 3 H$), 5.20(\mathrm{t}, 1 \mathrm{H}, J=6.8 \mathrm{~Hz}), 1.78(\mathrm{q}, 2 \mathrm{H}, J=6.3 \mathrm{~Hz}), 1.12-1.02(\mathrm{~m}, 4 \mathrm{H}), 0.75(\mathrm{t}, 3 \mathrm{H}, J=$ $6.6 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 167.5,152.9,140.1,137.1,135.3,129.1$ (2), 128.3 (2), 128.0, 127.8, 127.7 (2), 125.5, 122.5, 61.1, 32.2, 31.3, 22.7, 14.4; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 409.1020, found 409.1022.

165

(E)-N-(2-Ethyl-1-phenylpent-2-enyl)-5-methyl-1,3,4-thiadiazole-2-sulfonamide (165, Table 6 entry 4). According to general procedure $\mathrm{M}, \mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(81.9 \mathrm{mg}, 0.138 \mathrm{mmol})$, 1-hexyne
( $0.0410 \mathrm{~mL}, 0.360 \mathrm{mmol}$ ), $\mathrm{Me}_{2} \mathrm{Zn}(0.15 \mathrm{~mL}, 0.15 \mathrm{mmol}, 1.0 \mathrm{M})$ and a solution of $\mathbf{1 4 7}$ in toluene $(1.00 \mathrm{~mL}, 0.150 \mathrm{mmol}, 0.150 \mathrm{M})$ were combined in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.00 \mathrm{~mL})$ for 2 h . The same workup procedure was performed except that the crude reaction mixture was chromatographed on $\mathrm{SiO}_{2}$ (1:1 hexanes: EtOAc ) to give $165(25.1 \mathrm{mg}, 47 \%)$ as a white solid: $\mathrm{Mp} 98.5-99.5^{\circ} \mathrm{C}$; IR (KBr) 3122, 2965, 2872, 1455, 1357, 1170, 1043, $940 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 7.29-$ 7.81 (m, 5 H ), 5.80 (d, $1 \mathrm{H}, J=8.1 \mathrm{~Hz}), 5.31$ (t, $1 \mathrm{H}, J=7.1 \mathrm{~Hz}), 5.19(\mathrm{~d}, 1 \mathrm{H}, J=8.1 \mathrm{~Hz}), 2.77$ (s, 3 H ), 2.13-1.86 (m, 4 H ), 0.90 (dt, $6 \mathrm{H}, \mathrm{J}=7.5,3.0 \mathrm{~Hz}$ ); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 169.5$, 168.9, 138.9, 138.5, 130.8, 128.7 (2), 127.9, 127.8 (2), 62.9, 22.1, 21.1, 15.9, 14.3, 13.7; HRMS (TOF MS ES + ) $m / z$ calculated for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 374.0973, found 374.0951.

Synthesis of (E)-N-(1-phenylhept-2-enyl)benzo[d]thiazole-2-sulfonamide (164) by the addition of $(\boldsymbol{E})$-hex-1-enyldimethylaluminum. To a suspension of $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(87.7 \mathrm{mg}$, $0.340 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.00 \mathrm{~mL})$ under a nitrogen atmosphere was added 1-hexyne (0.0402 $\mathrm{mL}, 0.350 \mathrm{mmol}$ ) at room temperature. After 15 min , the volatiles were removed from the zirconocene solution under high vacuum and the resulting yellow oil was dissolved in toluene $(1.00 \mathrm{~mL})$. This mixture was cooled to $0^{\circ} \mathrm{C}$ and a solution of $\mathrm{Me}_{3} \mathrm{Al}$ in toluene ( $0.34 \mathrm{~mL}, 0.34$ mmol, 1.0 M ) was added. The reaction mixture was warmed to room temperature for 1 h and then canulated under nitrogen gas into a solution of $146(45.5 \mathrm{mg}, 0.150 \mathrm{mmol})$ in toluene $(0.50$ mL ). The resulting yellow mixture was stirred at room temperature for 20 h and then quenched by the addition of a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5.0 mL ). After 30 min , the quenched mixture was partitioned between a saturated brine solution ( 10.0 mL ) and ether ( 20.0 mL ). The aqueous layer was extracted with ether ( 2 X 20.0 mL ). The combined ether layers were filtered through a 1 in pad of $\mathrm{SiO}_{2}$ which was washed with additional EtOAc (20.0 mL), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and
concentrated by rotary evaporation. The resulting crude residue was chromatographed on $\mathrm{SiO}_{2}$ (1:3 EtOAc: hexanes) to give 164 ( $9.4 \mathrm{mg}, 16 \%$ ) as a clear oil.

General procedure N. Rhodium(I) catalyzed additions of alkenyl- zirconocnes. (E)-N-(1-Phenylhept-2-enyl)benzo[d]thiazole-2-sulfonamide (164, Table 7 entry 3). To a suspension of $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(87.7 \mathrm{mg}, 0.340 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.00 \mathrm{~mL})$ under a nitrogen atmosphere was added 1-hexyne ( $0.0402 \mathrm{~mL}, 0.350 \mathrm{mmol}$ ) at room temperature. After 15 min , the volatiles were removed from the zirconocene solution under high vacuum and the resulting yellow oil was dissolved in degassed dioxane ( 0.50 mL ). The zirconocene solution was then canulated under nitrogen gas into a premixed solution of (1S,4S,8S)-5-benzyl-8-methoxy-1,8-dimethyl-2-(2'-methylpropyl)-bicyclo[2.2.2]octa-2,5-diene 168 ( $4.66 \mathrm{mg}, 0.0150 \mathrm{mmol}$ ) and [RhCl(ethylene) $\left.)_{2}\right]_{2}$ ( $2.9 \mathrm{mg}, 0.0075 \mathrm{mmol}$ ) in degassed dioxane $(0.50 \mathrm{~mL})$ at room temperature. To this mixture was then added, via cannulation under nitrogen gas, a solution of $R, R$-MeDUPHOS $167(4.6 \mathrm{mg}$, 0.015 mmol ) and 146 ( $45.4 \mathrm{mg}, 0.150 \mathrm{mmol}$ ) in degassed dioxane ( 0.50 mL ). The reaction mixture was stirred under nitrogen gas for 20 h and then quenched with a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5.0 mL ) with stirring for 50 min . The quenched mixture was partitioned between a saturated brine solution ( 10.0 mL ) and ether ( 20.0 mL ). The aqueous layer was extracted with ether (2 X 20.0 mL ). The combined ether layers were filtered through a 2 in pad of $\mathrm{SiO}_{2}$ which was washed with additional EtOAc ( 25.0 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting crude residue was chromatographed on $\mathrm{SiO}_{2}$ (1:3 EtOAc: hexanes) to give 164 ( $4.30 \mathrm{mg}, 7.0 \%$ ) as a slightly impure yellow oil. A sample of this product was dissolved in a 99:1 mixture of hexanes and $i$-PrOH for chiral HPLC (chiralcel-OD column; 99:1
hexanes : i-PrOH; flow rate $1.0 \mathrm{~mL} / \mathrm{min}$; UV detection at 258 nm ; product enantiomer retention times of 39.3 and 59.7 min and areas of 61.4 and 16.2) which showed $58 \%$ ee.
(E)-N-(1-Phenylhept-2-enyl)benzo[d]thiazole-2-sulfonamide (164, Table 7 entry 2). According to general procedure N , a solution of $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(58.0 \mathrm{mg}, 0.225 \mathrm{mmol})$, 1-hexyne ( $0.0287 \mathrm{~mL}, 0.250 \mathrm{mmol}),[\mathrm{RhCl}(\mathrm{cod})]_{2}(2.9 \mathrm{mg}, 0.0075 \mathrm{mmol}), 168(4.66 \mathrm{mg}, 0.0150 \mathrm{mmol})$ and 146 ( $45.4 \mathrm{mg}, 0.150 \mathrm{mmol}$ ) were combined in degassed dioxane for 24 h . No product was detected by TLC.
(E)-N-(1-Phenylhept-2-enyl)benzo[d]thiazole-2-sulfonamide (164, Table 7 entry 2). According to general procedure N , a solution of $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}(87.7 \mathrm{mg}, 0.340 \mathrm{mmol})$ and 1hexyne ( $0.0340 \mathrm{~mL}, 0.300 \mathrm{mmol}$ ) were combined, after a solvent switch to toluene ( 0.50 mL ), with a solution of $[\mathrm{RhCl}(\mathrm{cod})]_{2}(3.7 \mathrm{mg}, 0.0078 \mathrm{mmol}), R, R-\mathrm{MeDUPHOS}(4.6 \mathrm{mg}, 0.015 \mathrm{mmol})$ and $146(45.4 \mathrm{mg}, 0.150 \mathrm{mmol})$ in toluene $(1.00 \mathrm{~mL})$ for 16 h . The product $164(11.0 \mathrm{mg}, 19 \%)$ was obtained as a clear oil in 1\% ee (determined by chiral HPLC analysis).

Synthesis of Tetrakis[acetonitrile]copper(I) tetrafluoroborate (169). ${ }^{60}$ To a suspension of $\mathrm{Cu}_{2} \mathrm{O}(0.750 \mathrm{~g}, 5.24 \mathrm{mmol})$ in acetonitrile $(14.0 \mathrm{~mL})$ was slowly added a solution of $\mathrm{HBF}_{4}(2.77$ $\mathrm{mL}, 15.1 \mathrm{mmol}, 48 \%$ ) over a 5 min period under a nitrogen atmosphere. After 10 min , the reaction mixture was quickly filtered and transferred to a dry 50 mL round bottom flask. This solution was then cooled to $-30^{\circ} \mathrm{C}$ for 20 min under nitrogen gas and a crystalline solid formed. The resulting solid was isolated by filtration, washed with ether ( 20 mL ) and dried under high
vacuum for 3 h . The resulting $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{BF}_{4}(1.24 \mathrm{~g}, 75 \%)$ was isolated as a clear crystalline solid: Mp 160-162 ${ }^{\circ} \mathrm{C}$.

General procedure $O$. Copper(I) catalyzed additions of alkenylzirconocenes. (E)-N-(1-Phenylhept-2-enyl)benzo[d]thiazole-2-sulfonamide (164, Table 8 entry 1). To a solution of $\mathrm{Cp}_{2} \mathrm{ZrCl}_{2}(49.7 \mathrm{mg}, 0.170 \mathrm{mmol})$ in THF $(0.50 \mathrm{~mL})$ cooled to $0{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere was added a solution of DIBAL-H in hexanes ( $0.17 \mathrm{~mL}, 0.17 \mathrm{mmol}, 1.0 \mathrm{M}$ ) over a 15 min period. After 30 min at $0{ }^{\circ} \mathrm{C}$, a white $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}$ suspension formed and 1-hexyne ( 0.0172 mL , 0.150 mmol ) was added. This mixture was warmed to room temperature and became homogenous after 1 h . The mixture was then added to a premixed solution of 146 ( 45.4 mg , $0.150 \mathrm{mmol})$ and $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{BF}_{4}(2.40 \mathrm{mg}, 0.00750 \mathrm{mmol})$ in THF $(0.50 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere. The reaction mixture was warmed to room temperature and stirred for 2 d . The reaction was quenched by the addition of a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5.0 mL ) with stirring for 50 min , and partitioned between a saturated brine solution ( 10.0 mL ) and ether ( 20.0 mL ). The aqueous layer was extracted with ether ( 2 X 20.0 mL ). The combined ether layers were filtered through a 1 in pad of $\mathrm{SiO}_{2}$ which was washed with additional EtOAc ( 25.0 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting crude residue was chromatographed on $\mathrm{SiO}_{2}$ (1:3 EtOAc: hexanes) to give 164 (1.5 mg, 3\%) as an impure clear oil.

$N$-(3-Methyl-1-phenylbutyl)benzo[d]thiazole-2-sulfonamide (170, Table 8 entry 2). According to general procedure $\mathrm{O}, \mathrm{Cp}_{2} \mathrm{ZrCl}_{2}(99.4 \mathrm{mg}, 0.340 \mathrm{mmol})$, DIBAL-H ( $0.34 \mathrm{~mL}, 0.34$ mmol, 1.0 M), 1-hexyne ( $0.0344 \mathrm{~mL}, 0.300 \mathrm{mmol}$ ), $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{BF}_{4}(4.80 \mathrm{mg}, 0.0150 \mathrm{mmol})$ and $\mathbf{1 4 6}$ ( $45.4 \mathrm{mg}, 0.150 \mathrm{mmol}$ ) were combined, and then $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}(0.0565 \mathrm{~mL}, 0.450 \mathrm{mmol})$ was added. The resulting purple reaction mixture was stirred at room temperature for 18 h to give 170 ( $34.0 \mathrm{mg}, 63 \%$ ) as a white crystalline solid: $\mathrm{Mp} 122-123{ }^{\circ} \mathrm{C}$; IR ( KBr ) 3182, 2957, $1455,1426,1356,1170,1052,930,763 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.01(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}=$ 8.1, 1.2 Hz ), $7.84(\mathrm{dd}, 1 \mathrm{H}, J=7.2,1.5 \mathrm{~Hz}), 7.52(\mathrm{dt}, 2 \mathrm{H}, J=7.5,1.2 \mathrm{~Hz}), 7.08(\mathrm{dd}, 2 \mathrm{H}, J=8.1$, $1.2 \mathrm{~Hz}), 7.01-6.93$ (m, 3 H ), $5.74(\mathrm{~d}, 1 \mathrm{H}, J=8.1 \mathrm{~Hz}), 4.65(\mathrm{q}, 1 \mathrm{H}, J=7.5 \mathrm{~Hz}), 1.82-1.73$ (m, 1 H), 1.66-1.50 (m, 2 H ), $0.88(\mathrm{t}, 6 \mathrm{H}, J=7.8 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 166.5,152.1$, 140.3, 136.5, 128.2 (2), 127.4, 127.3, 127.1, 126.6 (2), 124.9, 121.9, 57.7, 46.5, 24.6, 22.3, 22.2; HRMS (TOF MS ES+) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{18} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 383.0864, found 383.0868.
(E)-N-(1-Phenylhept-2-enyl)benzo[d]thiazole-2-sulfonamide (164, Table 8 entry 3). According to general procedure $\mathrm{O}, \mathrm{Cp}_{2} \mathrm{ZrCl}_{2}(99.4 \mathrm{mg}, 0.340 \mathrm{mmol})$, DIBAL-H ( $0.34 \mathrm{~mL}, 0.34$ mmol, 1.0 M ), 1-hexyne ( $0.0344 \mathrm{~mL}, 0.300 \mathrm{mmol}$ ), and 146 ( $45.4 \mathrm{mg}, 0.150 \mathrm{mmol}$ ) were combined and then $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$ ( $0.0565 \mathrm{~mL}, 0.450 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at room temperature for 16 h after which time no product $\mathbf{1 6 4}$ or $\mathbf{1 7 0}$ was noted by TLC.

### 4.3.3 Deprotection of $N$-Ths and $N$-Bts-sulfonamides

General procedure $P$. Deprotection of sulfonamides with $\mathbf{H}_{3} \mathrm{PO}_{2}$ and re-protection with Boc $_{2} \mathbf{O}$. Tert-butyl 1-phenylethylcarbamate (171, Table 9 entry 1). ${ }^{78}$ To a solution of sulfonamide 148 ( $200 \mathrm{mg}, 0.706 \mathrm{mmol}$ ) in refluxing THF ( 9.0 mL ) was slowly added a $\mathrm{H}_{3} \mathrm{PO}_{2}$ solution ( $2.3 \mathrm{~mL}, 21 \mathrm{mmol}, 50 \%$ ) via syringe pump over a 3.5 h period under a nitrogen atmosphere. The reaction mixture was heated at reflux for an additional 1 h after all of the $\mathrm{H}_{3} \mathrm{PO}_{2}$ solution was added. After this time, the reaction mixture was cooled to room temperature, diluted with deionized water ( 5.0 mL ) and washed with hexanes ( 5.0 mL ). The hexane layer was then washed with an HCl solution ( $2.0 \mathrm{~mL}, 0.50 \mathrm{M}$ ) and the aqueous layers were combined, cooled to $0^{\circ} \mathrm{C}$, basified to a $\mathrm{pH}>13$ with a NaOH solution ( $10 \mathrm{~mL}, 5.0 \mathrm{M}$ ) and extracted with ether ( 3 X 30 mL ). The combined ether layers were washed with a saturated brine solution ( 5.0 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting clear oil was then dissolved in $\mathrm{CH}_{3} \mathrm{CN}(3.0 \mathrm{~mL})$ and reacted with $\mathrm{Boc}_{2} \mathrm{O}(192 \mathrm{mg}, 0.883 \mathrm{mmol})$ in the presence of $\mathrm{Et}_{3} \mathrm{~N}(0.0980 \mathrm{~mL}, 0.760 \mathrm{mmol})$ under a nitrogen atmosphere. The reaction mixture was stirred at room temperature for 1 h and the solvent was then removed by rotary evaporation. The crude residue was chromatographed on $\mathrm{SiO}_{2}$ (20:1, hexanes: EtOAc to remove the excess $\mathrm{Boc}_{2} \mathrm{O}$ followed by 5:1 hexanes: EtOAc) to give 171 (132 mg, 84\%) as a clear crystalline solid: Mp 87-88 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3383, 2983, 1687, 1519, 1367, 1248, 1171, 1059, $756 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.32-7.23(\mathrm{~m}, 5 \mathrm{H}) 4.95(\mathrm{~s}, 1 \mathrm{H}), 4.74(\mathrm{~s}, 1 \mathrm{H}), 1.43$ (s, 3 H ), 1.41 (s, 9 H$)$;
${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 155.5,145.2,129.0(2), 127.5,126.4$ (2), 79.6, 50.8, 28.7 (3), 23.3; HRMS (TOF MS EI+) m/z calculated for $\mathrm{C}_{13} \mathrm{H}_{19} \mathrm{NO}_{2} \mathrm{Na}$ (M+Na) 244.1313, found 244.1309.

172

Tert-butyl benzhydrylcarbamate (172, Table 9 entry 2). ${ }^{79}$ According to general procedure P , sulfonamide 154 ( $50.0 \mathrm{mg}, 0.145 \mathrm{mmol}$ ) and $\mathrm{H}_{3} \mathrm{PO}_{2}$ ( $0.48 \mathrm{~mL}, 4.3 \mathrm{mmol}$, $50 \%$ ) were combined in THF ( 2.0 mL ) for 4.5 h . The isolated crude amine was then combined with $\mathrm{Boc}_{2} \mathrm{O}(39.5 \mathrm{mg}$, 0.181 mmol ) and $\mathrm{Et}_{3} \mathrm{~N}(0.020 \mathrm{~mL}, 0.145 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(1.5 \mathrm{~mL})$ for 1 h to give 172 (34.2 mg, 83\%) as a clear crystalline solid: Mp 123-124 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3373, 2978, 1690, 1520, 1363, 1173, 1022, $744 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 7.36-7.25(\mathrm{~m}, 10 \mathrm{H}), 5.93(\mathrm{~s}, 1 \mathrm{H}), 2.20(\mathrm{~s}$, 1 H ), 1.46 (s, 9 H ); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 155.0,142.1$ (2), 128.6 (4), 127.3 (2), 127.2 (4), 79.9, 58.5, 28.4 (3); HRMS (TOF MS ES+) $m / z$ calculated for $\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{NO}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na}$ ) 306.1470, found 306.1468.

173

Tert-butyl 1-phenylbut-2-ynylcarbamate (173, Table 9 entry 3). According to general procedure P , sulfonamide $153(70.0 \mathrm{mg}, 0.228 \mathrm{mmol})$ and $\mathrm{H}_{3} \mathrm{PO}_{2}(0.75 \mathrm{~mL}, 6.8 \mathrm{mmol})$ were combined in THF ( 5.0 mL ) for 4.5 h . The isolated crude amine was then combined with $\mathrm{Boc}_{2} \mathrm{O}$
( $59.7 \mathrm{mg}, 0.274 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(0.0318 \mathrm{~mL}, 0.228 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(3.0 \mathrm{~mL})$ for 1 h to give 173 (49.5 mg, 88\%) as a white crystalline solid: Mp 90-91 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3318, 2978, 1713, 1682, 1523, 1365, 1246, 1157, 1021, $880 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{MHz}\right) \delta 7.47(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=6.0$ Hz ), 7.38-7.27 (m, 3 H ), $5.55(\mathrm{~s}, 1 \mathrm{H}), 5.18(\mathrm{~s}, 1 \mathrm{H}), 1.88(\mathrm{~s}, 3 \mathrm{H}), 1.44(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 75 \mathrm{MHz}\right) \delta 155.1,140.8,128.9$ (2), 128.1, 127.1 (2), 81.1, 80.1, 77.9, 46.8, 28.4 (3), 3.6; HRMS (TOF MS ES+ $) \mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{NO}_{2} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 268.1313, found 268.1302.

General procedure Q. Deprotection of sulfonamides with $\mathrm{SmI}_{2}$ and re-protection with $\mathrm{Boc}_{2} \mathrm{O}$. Tert-butyl 1-phenylethylcarbamate (171, Table 10 entry 1). To a solution of sulfonamide $148(100 \mathrm{mg}, 0.353 \mathrm{mmol})$ in degassed THF $(1.0 \mathrm{~mL})$ was added a solution of $\mathrm{SmI}_{2}$ in THF ( $25 \mathrm{~mL}, 2.5 \mathrm{mmol}, 0.10 \mathrm{M}$ ) slowly over a 1 h period at room temperature under a nitrogen atmosphere. The reaction mixture turned from a dark blue color to yellow over 8 h . The mixture was quenched by pouring it into $\mathrm{KOH}(2.0 \mathrm{~g})$ and ice (20 g). This solution was warmed to room temperature and extracted with ether (3 X 50 mL ). The combined ether layers were concentrated by rotary evaporation $\left(13{ }^{\circ} \mathrm{C}\right)$. The resulting yellow residue was acidified with an HCl solution ( $10 \mathrm{~mL}, 1.0 \mathrm{M}$ ). The aqueous solution was washed with hexanes (1 X 10 mL ), cooled to $0^{\circ} \mathrm{C}$ and basified with a NaOH solution ( $5.0 \mathrm{~mL}, 5.0 \mathrm{M}$ ) to $\mathrm{pH}>13$. The basic mixture was extracted with ether ( 3 X 25 mL ). The combined ether layers were washed with a saturated brine solution (1 X 5.0 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation (13 $\left.{ }^{\circ} \mathrm{C}\right)$. The crude amine was then dissolved in $\mathrm{CH}_{3} \mathrm{CN}(1.5 \mathrm{~mL})$ and reacted with $\mathrm{Boc}_{2} \mathrm{O}(96.3 \mathrm{mg}$, $0.353 \mathrm{mmol})$ in the presence of $\mathrm{Et}_{3} \mathrm{~N}(0.0490 \mathrm{~mL}, 0.353 \mathrm{mmol})$ under a nitrogen atmosphere. The reaction mixture was stirred at room temperature for 1.5 h and the solvent was then removed
by rotary evaporation. The crude residue was chromatographed on $\mathrm{SiO}_{2}$ ( $10: 1$ hexanes: EtOAc ) to give 171 ( $65.4 \mathrm{mg}, 84 \%$ ) as a clear crystalline solid.

Tert-butyl 1-phenylethylcarbamate (171, Table 10 entry 2). According to general procedure Q, sulfonamide $155(100 \mathrm{mg}, 0.314 \mathrm{mmol})$ and $\mathrm{SmI}_{2}(28 \mathrm{~mL}, 2.8 \mathrm{mmol}, 0.10 \mathrm{M})$ were reacted in THF for 8 h . The isolated crude amine was then combined with $\mathrm{Boc}_{2} \mathrm{O}$ ( $85.7 \mathrm{mg}, 0.393 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(0.0438 \mathrm{~mL}, 0.314 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(1.5 \mathrm{~mL})$ for 1.5 h to give $171(57.4 \mathrm{mg}, 83 \%)$ as a white crystalline solid.

### 4.3.4 Addition of organometallic reagents to ( $E$ )- $N$-benzylidenebenzo[d]thiazole-2sulfinamide and ( $E$ )- N -benzylidenepyridine-2-sulfinamide.

175

Ethyl benzo[d]thiazole-2-sulfinate (175). To a solution of benzo[d]thiazole-2-thiol 142 (1.50 g, 8.97 mmol ) in EtOH ( 20 mL ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ cooled to $0{ }^{\circ} \mathrm{C}$ was added NBS ( 3.19 g , 17.9 mmol ) in one portion. The reaction mixture turned a dark red color, was warmed to room temperature for 4 h , and quenched by the addition of a saturated solution of $\mathrm{NaHCO}_{3}(40 \mathrm{~mL})$. This mixture was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ and the organic layer was washed with a saturated brine solution ( 40 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation. The resulting oily suspension was filtered and chromatographed on $\mathrm{SiO}_{2}$ (5:1 hexanes: EtOAc). The isolated product was dried by rotary evaporation, followed by high vacuum for 5 h affording 175 (1.57 g, 77\%) as a tan oil: IR (salt plate) 2983, 2934, 1733, 1471, 1314, 1139, 1002, 883, 762
$\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.18(\mathrm{~d}, 1 \mathrm{H}, J=8.4 \mathrm{~Hz}), 8.01(\mathrm{~d}, 1 \mathrm{H}, J=7.8 \mathrm{~Hz}), 7.63-$
$7.51(\mathrm{~m}, 2 \mathrm{H}), 4.43-4.36(\mathrm{~m}, 1 \mathrm{H}), 4.00-3.94(\mathrm{~m}, 1 \mathrm{H}), 1.39(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 176.2,154.1,136.6,127.7$ (2), 125.4, 122.9, 63.4, 16.1; MS (EI) m/z 227 ( $\left.{ }^{+}, 30\right), 183$ (98), 162 (89), 151 (58), 135 (100), 108 (81), 90 (58), 69 (43); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{NO}_{2} \mathrm{~S}_{2}$ 227.0075, found 227.0079.

176

Ethyl pyridine-2-sulfinate (176). To a solution of 174 ( $1.67 \mathrm{~g}, 14.7 \mathrm{mmol}$ ) in a $1: 1$ mixture of EtOH and DCM ( 60 mL ) was added NBS ( $5.23 \mathrm{~g}, 29.4 \mathrm{mmol}$ ) in one portion at $0^{\circ} \mathrm{C}$. The reaction mixture immediately turned orange in color, was warmed to room temperature over 1 h and was then diluted with a saturated $\mathrm{NaHCO}_{3}$ solution ( 50 mL ) followed by DCM ( 50 mL ). This mixture was stirred for 30 min , the aqueous layer was removed and the DCM layer was washed with a saturated brine solution ( 2 X 50 mL ). The DCM layer was then diluted with hexanes ( 50 mL ), filtered through a plug of $\mathrm{SiO}_{2}(2 \mathrm{in})$, washed through with $\mathrm{DCM}(100 \mathrm{~mL})$ and dried in vacuo to afford 176 as an orange oil ( $2.19 \mathrm{~g}, 83 \%$ ). This compound was used crude for the next step: ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.63(\mathrm{~d}, 1 \mathrm{H}, J=4.2 \mathrm{~Hz}), 8.03-7.93(\mathrm{~m}, 2 \mathrm{H}), 7.49-$ $7.46(\mathrm{~m}, 1 \mathrm{H}), 4.27-4.17(\mathrm{~m}, 1 \mathrm{H}), 3.89-3.78(\mathrm{~m}, 1 \mathrm{H}), 1.32(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 163.8,150.0,137.8,126.2,119.8,62.6,15.6$.

177

Benzo[d]thiazole-2-sulfinamide (177). To a solution of 175 (250 mg, 1.10 mmol ) in THF (5.0 mL ) cooled to $-78{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere was added a solution of LiHMDS in THF ( $1.43 \mathrm{~mL}, 1.43 \mathrm{mmol}, 1.00 \mathrm{M}$ ) dropwise over a 5 min period. The reaction mixture turned a
deep red color, stirred at $-78^{\circ} \mathrm{C}$ for 2 h , and quenched by pouring it at $-78^{\circ} \mathrm{C}$ into an Erlenmeyer flask containing a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 20 mL ). This mixture was stirred for 30 min , while warming to room temperature, and then extracted with EtOAc ( 3 X 10 mL ). The combined EtOAc layers were washed with a saturated brine solution (10 mL), dried ( $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), concentrated to 20 mL by rotary evaporation and filtered through a 1 in plug of $\mathrm{SiO}_{2}$ which was washed with additional EtOAc ( 50 mL ). The filtrate was concentrated by rotary evaporation and the resulting solids were recrystallized from a $2: 1$ solution of EtOAc and hexanes ( 30 mL ). The solid was washed with a 2:1 solution of EtOAc and hexanes ( 20 mL ) and dried under high vacuum for 15 h to give 177 (125 mg, 57\%) as a light yellow crystalline solid: Mp 141-142 ${ }^{\circ} \mathrm{C}$ (dec); IR ( KBr ) 3310, 3174, 3083, 1474, 1426, 1040, 892, $761 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}\right.$, 300 MHz ) $\delta 8.24$ (d, 1 $\mathrm{H}, J=7.5 \mathrm{~Hz}), 8.12(\mathrm{~d}, 1 \mathrm{H}, J=7.8 \mathrm{~Hz}), 7.59(\mathrm{~m}, 2 \mathrm{H}), 7.18(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75\right.$ $\mathrm{MHz}) \delta$ 179.5, 153.4, 136.2, 126.9, 126.3, 123.7, 122.8; MS (EI) $\mathrm{m} / \mathrm{z} 198$ ( ${ }^{+}$, 4.5), 182 (40), 167 (14), 150 (81), 135 (100), 108 (86), 90 (67), 69 (86); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{OS}_{2}$ 197.9922, found 197.9919.

178

Pyridine-2-sulfinamide (178). To a solution of 176 ( $6.47 \mathrm{~g}, 34.4 \mathrm{mmol}$ ) in dry THF ( 100 mL ) was added a solution of LiHMDS ( $37.8 \mathrm{~mL}, 37.8 \mathrm{mmol}, 1.0 \mathrm{M}$ ) in THF, over 5 min at $-65{ }^{\circ} \mathrm{C}$. The reaction mixture turned a dark brown/red color during the addition, was stirred at $-65{ }^{\circ} \mathrm{C}$ for 1 h and was quenched by addition to a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 100 mL ). The resulting mixture was stirred at room temperature for 1 h and then diluted with EtOAc ( 50 mL ). The EtOAc layer was removed and the aqueous layer was extracted with EtOAc (2 X 100 mL ). The

EtOAc extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and filtered through a plug of $\mathrm{SiO}_{2}(1 \mathrm{in})$ with additional EtOAc ( 200 mL ). The EtOAc was removed in vacuo and the resulting solids were recrystallized from a 1:2 mixture of hexanes to EtOAc (a seed crystal was added to initiate crystallization). The resulting light brown precipitate was isolated by vacuum filtration, washed with hexanes ( 20 mL ) and dried in vacuo to afford 178 (985 mg, 20\%): Mp 108.0-109.5 ${ }^{\circ} \mathrm{C}$ (dec.); IR (KBr) 3226, 3075, 2699, 1580, 1451, 1426, 1086, 1056, $877 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $300 \mathrm{MHz}) \delta 8.71(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=4.2 \mathrm{~Hz}), 7.97-7.89(\mathrm{~m}, 2 \mathrm{H}), 7.46-7.42(\mathrm{~m}, 1 \mathrm{H}), 7.47(\mathrm{br}-\mathrm{s}, 2 \mathrm{H}) ;$ ${ }^{13}{ }^{1} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 164.4,150.0,138.0,125.6,120.6$; MS (EI) $\mathrm{m} / \mathrm{z} 142\left(\mathrm{M}^{+}, 2.6\right), 126$ (4.7), 110 (4.5), 96 (36), 79 (100); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{5} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{OS} 142.0201$, found 142.0199.

(E)-N-Benzylidenebenzo[d]thiazole-2-sulfinamide (179). To a suspension of 177 (200 mg, 1.00 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15.0 \mathrm{~mL})$ under a nitrogen atmosphere was added benzaldehyde 110 $(0.102 \mathrm{~mL}, 1.00 \mathrm{mmol})$ and $\mathrm{Ti}(\mathrm{OEt})_{4}(0.418 \mathrm{~mL}, 2.02 \mathrm{mmol})$ at room temperature. After 1.5 h , the solution turned a dark orange color and the reaction was quenched by the addition of $\mathrm{SiO}_{2}$ $(1.00 \mathrm{~g})$ with stirring for 15 min . The resulting suspension was filtered through a 1 in plug of $\mathrm{SiO}_{2}$ which was washed with additional $\mathrm{CH}_{2} \mathrm{Cl}_{2}(75 \mathrm{~mL})$. The filtrate was concentrated by rotary evaporation and the resulting pale yellow oil was placed under high vacuum for 12 h when it crystallized affording 179 (228 mg, 79\%) as a pale yellow crystalline solid: Mp 101-102.5 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3055, 1604, 1569, 1312, 1097, 994, $760 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.93$ (s, 1
H), $8.22(\mathrm{~d}, 1 \mathrm{H}, J=8.1 \mathrm{~Hz}), 7.96(\mathrm{t}, 3 \mathrm{H}, J=6.6 \mathrm{~Hz}), 7.61-7.48(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75\right.$ $\mathrm{MHz}) \delta 174.0,163.7,153.3,136.3,133.6,133.4,130.2$ (2), 129.2 (2), 127.0, 126.9, 124.8, 122.1; MS (EI) m/z 286 ( $\mathrm{M}^{+}, 4.4$ ), 183 (33), 167 (67), 135 (28), 103 (100), 76 (36); HRMS (EI) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{OS}_{2}$ 286.0235, found 286.0242.

(E)-N-benzylidenepyridine-2-sulfinamide (180). To a suspension of $\mathbf{1 7 8}$ ( $400 \mathrm{mg}, 2.81 \mathrm{mmol}$ ) and $110(0.286 \mathrm{~mL}, 2.81 \mathrm{mmol})$ in dry $\mathrm{DCM}(30 \mathrm{~mL})$ was added $\mathrm{Ti}(\mathrm{OEt})_{4}(1.17 \mathrm{~mL}, 5.63$ mmol ). The reaction mixture turned a deep orange color and cleared after 2 h . After $2 \mathrm{~h}, \mathrm{SiO}_{2}$ $(1.00 \mathrm{~g})$ was added with stirring for 15 min . The resulting slurry was vacuum filtered through a plug of $\mathrm{SiO}_{2}(1.5 \mathrm{in})$ and washed with additional DCM $(150 \mathrm{~mL})$. The clear pale yellow filtrate was dried in vacuo to afford 180 as an off white solid ( $577 \mathrm{mg}, 89 \%$ ): Mp $90.0-91.0^{\circ} \mathrm{C}$ (dec.); IR (KBr) 3057, 1605, 1573, 1448, 1423, 1214, 1098, 1070, $756 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 300$ $\mathrm{MHz}) \delta 8.85(\mathrm{~s}, 1 \mathrm{H}), 8.75(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=4.2 \mathrm{~Hz}), 7.94-7.88(\mathrm{~m}, 4 \mathrm{H}), 7.54-7.44(\mathrm{~m}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 164.1,161.8,150.1,138.1,133.8,132.8,129.8$ (2 C), 128.9 (2 C), 125.5, 119.2; MS (EI) m/z 230 (M ${ }^{+}$, 3), 181 (27), 152 (31), 127 (99), 103 (95), 79 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{12} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{OS} 230.0514$, found 230.0503.

181

General procedure R. $\boldsymbol{N}$-(1-Phenylethyl)benzo[d]thiazole-2-sulfinamide (181). To a solution of aldimine 179 ( $30.0 \mathrm{mg}, 0.105 \mathrm{mmol}$ ) in THF ( 1.0 mL ) at $-78{ }^{\circ} \mathrm{C}$ was added dropwise a solution of MeMgBr in ether $(0.070 \mathrm{~mL}, 0.21 \mathrm{mmol}, 3.0 \mathrm{M})$ under a nitrogen atmosphere. The reaction mixture was stirred for 1 h , quenched by adding a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 3.0 mL ) at $-78{ }^{\circ} \mathrm{C}$, slowly warmed to room temperature over a 30 min period and partitioned between a saturated brine solution $(10 \mathrm{~mL})$ and ether $(10 \mathrm{~mL})$. The aqueous layer was extracted with ether (2 X 10 mL ), the combined ether extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, condensed by rotary evaporation and dissolved in a minimum amount of EtOAc for chromatography on $\mathrm{SiO}_{2}$ (2:1 hexanes: EtOAc) to give two products (A and B). These products were dried in vacuo to afford $\mathbf{1 8 1}$ (Product A, $2.1 \mathrm{mg}, 7 \%$ ) isolated impure as an off white solid: ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta$ 7.56 (d, $2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 7.45-7.11(\mathrm{~m}, 6 \mathrm{H}), 7.09(\mathrm{t}, 1 \mathrm{H}, J=7.5 \mathrm{~Hz}), 5.76(\mathrm{~s}, 1 \mathrm{H}), 4.87(\mathrm{q}, 1 \mathrm{H}$, $J=6.0 \mathrm{~Hz}), 1.68(\mathrm{~d}, 3 \mathrm{H}, J=6.6 \mathrm{~Hz}) . \mathrm{A}^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right)$ of fraction B showed $\mathbf{1 8 2}(4.2 \mathrm{mg}$, $24 \%$ ) as clear oil.

182

(E)-N-Benzylidenemethanesulfinamide (182). According to general procedure R, aldimine 179 ( $30.0 \mathrm{mg}, 0.105 \mathrm{mmol}$ ) was combined with a solution of MeMgBr in ether ( $0.039 \mathrm{~mL}, 0.12$ mmol, 3.0 M ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.0 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$. The reaction mixture was warmed to $0{ }^{\circ} \mathrm{C}$ for 3 h .

The product $182(9.8 \mathrm{mg}, 56 \%)$ was isolated as a clear oil: ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.66$ (s, 1 H ), $7.89(\mathrm{~d}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 7.57-7.51(\mathrm{~m}, 3 \mathrm{H}), 2.74(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right)$ $\delta 161.8,133.9,132.7,129.5$ (2), 129.0 (2), 42.9; MS (EI) m/z 167 ( $\mathrm{M}^{+}, 34$ ), 156 (100), 104 (36), 77 (73). HRMS (EI) $m / z$ calculated for $\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{NOS} 167.0405$, found 167.0400 .

General Procedure S. $N$-(1-phenylpropyl)pyridine-2-sulfinamide (183, Table 11 entry 3). To a solution of $\mathbf{1 8 0}(23.0 \mathrm{mg}, 0.100 \mathrm{mmol})$ and $\mathrm{Cu}(\mathrm{OTf})_{2}(3.6 \mathrm{mg}, 0.010 \mathrm{mmol})$ in DCM (1.0 $\mathrm{mL})$ was added a solution of $\mathrm{Et}_{2} \mathrm{Zn}(0.200 \mathrm{~mL}, 0.200 \mathrm{mmol}, 1.0 \mathrm{M})$ in DCM at $0{ }^{\circ} \mathrm{C}$. The reaction mixture turned from yellow to purple upon the addition, was stirred under nitrogen gas for 20 h and was quenched by the addition of a saturated $\mathrm{NaHCO}_{3}$ solution ( 5.0 mL ) with stirring for 30 min . The resulting mixture was partitioned between $\mathrm{DCM}(10 \mathrm{~mL})$ and a saturated brine solution (10 mL). The DCM layer was kept and the aqueous layer was extracted with DCM (2 X $10 \mathrm{~mL})$. The combined DCM layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo. The resulting yellow residue was dissolved in $\mathrm{DCM}\left(\sim 0.5 \mathrm{~mL}\right.$ ) and chromatographed on $\mathrm{SiO}_{2}$ (3:1 EtOAc:Hexanes). The product was isolated $\left(\mathrm{R}_{\mathrm{f}}=0.32\right)$ and dried in vacuo to afford $\mathbf{1 8 3}$ as a clear oil (12.3 mg, 47\% yield, 2:1 d.r.): IR (KBr) 3216, 2966, 2931, 2875, 1577, 1453, 1423, 1089, 1041, $773 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 300 \mathrm{MHz}, 2: 1$ mixture of diastereoisomers) $\delta 8.75$ (s, $0.67 \mathrm{H}), 8.50(\mathrm{~s}, 0.34 \mathrm{H}), 8.20-7.90(\mathrm{~m}, 1.25 \mathrm{H}), 7.86-7.83(\mathrm{~m}, 0.33 \mathrm{H}), 7.76-7.71(\mathrm{~m}, 0.38 \mathrm{H})$, 7.41-7.27 (m, 3.67 H), 7.25-7.23 (m, 0.34 H), 7.18-7.08 (m, 1.22 H), 4.85 (br-s, 0.66 H), 4.72 (br-s, 0.34 H ), 4.44-4.42 (m, 1 H ), 2.07-1.96 (m, 0.45 H ), 1.89-1.08 (m, 1.66 H), 0.89-0.84 (m, 3
$\mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 164.5,163.8,150.7,150.3,142.4,141.9,138.4,137.9,129.2$ (2 C), 128.8 (2 C), 128.3 (4C), 127.8 (2 C), 126.2, 125.6, 121.7, 121.4, 60.2, 57.7, 31.6, 31.4, 11.1, 11.0; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{OSNa} 283.0881$, found 283.0901 .
$N$-(1-phenylpropyl)pyridine-2-sulfinamide (183, Table 11 entry 1). According to general procedure S , 180 ( $23.0 \mathrm{mg}, 0.100 \mathrm{mmol}$ ) and $\mathrm{Et}_{2} \mathrm{Zn}$ in $\mathrm{DCM}(0.200 \mathrm{~mL}, 0.200 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were reacted in DCM (1.0 mL) at room temperature for 24 h to afford 183 crude ( $6.0 \mathrm{mg}, 17 \%$, dr 1:1).
$N$-(1-phenylpropyl)pyridine-2-sulfinamide (183, Table 11 entry 2). According to general procedure S , $180(23.0 \mathrm{mg}, 0.100 \mathrm{mmol}), \mathrm{Cu}(\mathrm{OTf})_{2}(3.6 \mathrm{mg}, 0.010 \mathrm{mmol})$ and $\mathrm{Et}_{2} \mathrm{Zn}$ in toluene $(0.200 \mathrm{~mL}, 0.200 \mathrm{mmol}, 1.0 \mathrm{M})$ were reacted in toluene $(1.0 \mathrm{~mL})$ at room temperature for 20 h to afford 183 (12.2 mg, 47\%, dr 1:1).
$N$-(1-phenylpropyl)pyridine-2-sulfinamide (183, Table 11 entry 4). According to general procedure S , $180(23.0 \mathrm{mg}, 0.100 \mathrm{mmol}), \mathrm{Cu}(\mathrm{OTf})_{2}(3.6 \mathrm{mg}, 0.010 \mathrm{mmol})$ and $\mathrm{Et}_{2} \mathrm{Zn}$ in THF ( $0.200 \mathrm{~mL}, 0.200 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were reacted in THF ( 1.0 mL ) at $0^{\circ} \mathrm{C}$ for 15 h to afford a trace amount of $\mathbf{1 8 3}$ by TLC ( $\mathrm{SiO}_{2}, 3: 1 \mathrm{EtOAc}$ :hexanes $)$.

$N$-(cyclohexyl(phenyl)methyl)pyridine-2-sulfinamide (184, Table 11 entry 5). According to general procedure S , $180(23.0 \mathrm{mg}, 0.100 \mathrm{mmol}), \mathrm{Cu}(\mathrm{OTf})_{2}(3.6 \mathrm{mg}, 0.010 \mathrm{mmol})$ and cyclohexylzinc bromide in THF ( $0.400 \mathrm{~mL}, 0.200 \mathrm{mmol}, 0.50 \mathrm{M}$ ) were reacted in DCM (1.0 mL ) at room temperature for 24 h . The product was isolated by chromatography on $\mathrm{SiO}_{2}$ (2:1 EtOAc:hexanes; $\mathrm{R}_{\mathrm{f}}=0.30$ ) to afford 184 as a clear oil (20.1 mg, $64 \%$, dr 3.5:1): IR ( KBr ) 3228, 2926, 2852, 1577, 1451, 1423, 1089, $1039 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}, 3.5: 1\right.$ mixture of diastereoisomers) $\delta 8.72$ (br-s, 0.23 H ), 8.63 (br-s, 0.77 H ), 7.85-7.76 (m, 1.24 H), 7.68-7.63 (m, 0.79 H), 7.42-7.34 (m, 1.24 H), 7.15-7.06 (m, 2.80 H), 6.94 (br-s, 1.56 H ), 5.00 (br-s, 0.23 H ), 4.84 (br-s, 0.79 H ), 4.23 (br-s, 1 H ), 1.98-1.82 (m, 1.22 H ), 1.79-1.75 (m, 1.44 H ), 1.41 (d, 1.44 $\mathrm{H}, \mathrm{J}=10.8 \mathrm{~Hz}$ ), 1.26-1.00 (m, 5 H ), 0.96-0.85 (m, 2 H ); HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{OSNa} 337.1351$, found 337.1321.
$N$-(cyclohexyl(phenyl)methyl)pyridine-2-sulfinamide (184, Table 11 entry 6). According to general procedure S , 180 ( $23.0 \mathrm{mg}, 0.100 \mathrm{mmol}$ ), $\mathrm{Cu}(\mathrm{OTf})_{2}$ ( $3.6 \mathrm{mg}, 0.010 \mathrm{mmol}$ ) and cyclohexylzinc bromide in THF ( $0.400 \mathrm{~mL}, 0.200 \mathrm{mmol}, 0.50 \mathrm{M}$ ) were reacted in DCM (1.0 $\mathrm{mL})$ at $0{ }^{\circ} \mathrm{C}$ for 24 h . The product was isolated by chromatography on $\mathrm{SiO}_{2}$ (2:1 EtOAc:hexanes; $\left.\mathrm{R}_{\mathrm{f}}=0.30\right)$ to afford 184 (19.9 mg, 63\%, dr 4:1).

General Procedure T. N-(1-phenylbut-2-ynyl)pyridine-2-sulfinamide (185, Table 11 entry
9). To a solution of $\mathrm{ZnBr}_{2}(45.0 \mathrm{mg}, 0.200 \mathrm{mmol})$ in THF $(0.20 \mathrm{~mL})$ cooled to $0^{\circ} \mathrm{C}$ was added a solution of 1-propynylmagnesium bromide in THF ( $0.400 \mathrm{~mL}, 0.200 \mathrm{mmol}, 0.50 \mathrm{M}$ ). The resulting white suspension was slowly warmed to room temperature for 30 min and was then added via syringe to a yellow/orange homogenous mixture of $\mathbf{1 8 0}$ ( 23.0 mg 0.100 mmol ) and $\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{CuBF}_{4}(3.2 \mathrm{mg}, 0.010 \mathrm{mmol})$ in $\mathrm{DCM}(1.0 \mathrm{~mL})$. The resulting green/yellow slightly heterogeneous reaction mixture was stirred at room temperature for 22 h and then a saturated $\mathrm{NaHCO}_{3}$ solution ( 5.0 mL ) was added with stirring for 30 min . The resulting mixture was diluted with DCM (10 mL), washed with a saturated brine solution (10 mL) and the aqueous layer was extracted with DCM (2 X 10 mL ). The combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, condensed in vacuo and dissolved in a minimum amount of DCM for chromatography on $\mathrm{SiO}_{2}$ (2:1 EtOAc: hexanes; $\mathrm{R}_{\mathrm{f}}=0.33$ ). The product was isolated and dried in vacuo to afford $\mathbf{1 8 5}$ as a clear oil (13.4 mg, 50\%, dr 3.5:1): IR (KBr) 3441, 3203, 2918, 1577, 1453, 1424, 1092, 1064, $1040 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}, 3.5: 1\right.$ mixture of diastereoisomers) $\delta 8.75(\mathrm{~d}, 0.22 \mathrm{H}, \mathrm{J}=$ $4.5 \mathrm{~Hz}), 8.62(\mathrm{~d}, 0.78 \mathrm{~Hz}, J=4.2 \mathrm{~Hz}), 8.04(\mathrm{~d}, 0.22 \mathrm{H}, J=7.8 \mathrm{~Hz}), 7.94(\mathrm{~d}, 0.78 \mathrm{H}, J=7.5 \mathrm{~Hz})$, 7.93-7.91 (m, 0.22 H), 7.83 (dt, $0.78 \mathrm{H}, J=7.4,1.2 \mathrm{~Hz}$ ), 7.58 (d, $0.44 \mathrm{H}, J=7.2 \mathrm{~Hz}$ ), 7.44-7.20 (m, 6 H ), $5.39-5.33$ (m, 0.22 H ), $5.28-5.26(\mathrm{~m}, 0.78 \mathrm{H}), 4.93$ (d, $0.78 \mathrm{H}, J=4.5 \mathrm{~Hz}), 4.79$ (d, $0.22 \mathrm{H}, J=4.8 \mathrm{~Hz}), 1.91(\mathrm{~d}, 2.29 \mathrm{H}, J=2.1 \mathrm{~Hz}), 1.72(\mathrm{~d}, 0.66 \mathrm{H}, J=2.4 \mathrm{~Hz}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right.$, $75 \mathrm{MHz}) \delta 163.6,150.6,150.5,139.9,138.3,138.2,129.3$ (2 C), 129.1 (2 C), 128.9, 128.7,
128.5 (2 C), 128.1 (2 C), 126.0, 121.8, 121.6, 84.0, 78.0, 48.6, 47.8, 4.5, 4.3; HRMS (TOF MS ES+) $m / z$ calculated for $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{OSNa}$ 293.0725, found 293.0732.
$N$-(1-phenylbut-2-ynyl)pyridine-2-sulfinamide (185, Table 11 entry 7). According to general procedure T, $180(23.0 \mathrm{mg}, 0.100 \mathrm{mmol})$ and 1-propynylmagnesium bromide in THF ( 0.300 mL , $0.150 \mathrm{mmol}, 0.50 \mathrm{M})$ were reacted in $\mathrm{DCM}(1.0 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ for 3 h to afford $185(12.9 \mathrm{mg}$, 48\%, dr 1:1).
$N$-(1-phenylbut-2-ynyl)pyridine-2-sulfinamide (185, Table 11 entry 8). According to general procedure T, 1-propynylmagnesium bromide in THF ( $0.400 \mathrm{~mL}, 0.200 \mathrm{mmol}, 0.5 \mathrm{M}$ ) and $\mathrm{ZnCl}_{2}$ in THF ( $0.200 \mathrm{~mL}, 0.200 \mathrm{mmol}, 1.0 \mathrm{M}$ ) were mixed at $-78{ }^{\circ} \mathrm{C}$, warmed to room temperature and then reacted with $180(23.0 \mathrm{mg}, 0.100 \mathrm{mmol})$ and $\mathrm{Cu}(\mathrm{OTf})_{2}(3.6 \mathrm{mg}, 0.010 \mathrm{mmol})$ in $\mathrm{DCM}(1.0$ mL ) at room temperature for 21 h to afford 185 ( $3.6 \mathrm{mg}, 13 \%, \mathrm{dr} 1: 1$ ).
$N$-(1-phenylbut-2-ynyl)pyridine-2-sulfinamide (185, Table 11 entry 10). According to general procedure T , $\mathrm{ZnI}_{2}$ ( $63.8 \mathrm{mg}, 0.200 \mathrm{mmol}$ ), 1-propynylmagnesium bromide in THF ( 0.400 $\mathrm{mL}, 0.200 \mathrm{mmol}, 0.5 \mathrm{M}), 180(23.0 \mathrm{mg}, 0.100 \mathrm{mmol})$ and $\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{CuBF}_{4}(3.2 \mathrm{mg}, 0.010$ $\mathrm{mmol})$ in DCM ( 1.0 mL ) were reacted at room temperature for 17 h to afford 185 (16.3 mg, 60\%, dr 2.9:1).

### 4.4 SYNTHESIS OF SID 861574 AND RELATED PLK1-PBD INHIBITORS

### 4.4.1 First generation analogues of SID 861574

Ethyl 4-(6-hydroxy-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxamido) benzoate (205, DMA-NB74-1). To a solution of barbituric acid ( $124 \mathrm{mg}, 0.970 \mathrm{mmol}$ ) in DMF ( 1.5 mL ) was added dropwise $\mathrm{Et}_{3} \mathrm{~N}(0.273 \mathrm{~mL}, 1.94 \mathrm{mmol})$ at room temperature. A white precipitate formed during the addition. The resulting suspension was stirred at room temperature for 30 min and then ethyl-4-isocyanatobenzoate ( $191 \mathrm{mg}, 0.970 \mathrm{mmol}$ ) was added. The suspension turned pale yellow following the addition and was stirred at room temperature for 15 h . After 15 h , the reaction mixture was acidified with an HCl solution ( $\sim 3.0 \mathrm{~mL}, 1.2 \mathrm{M}, \mathrm{pH}=0$ ). The resulting white solids were isolated by vacuum filtration, washed with deionized water ( 30 mL ) and heated in boiling EtOH ( 20 mL ) for 15 min followed by cooling to room temperature. The white precipitate was isolated by vacuum filtration, washed with EtOH ( 30 mL ) and dried in vacuo to afford 205 as a white solid (223 mg, 72\%): Mp 340-340.5 ${ }^{\circ} \mathrm{C}$; IR (KBr) 3214, 2986, 2808, 1744, $1705,1637,1603,1495,1417,1280,1111,853 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 300 \mathrm{MHz}\right) \delta 17.33(\mathrm{~s}$, $1 \mathrm{H}), 11.86$ (s, 2 H ), 11.71 (s, 1 H ), 7.95 (d, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), 7.66 (d, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), 4.29 (q, 2 $\mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}$ ), $1.32(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=7.0 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 169.5,165.5(3 \mathrm{C})$, 148.9, 141.0, 130.9 (2 C), 126.3, 120.7 (2 C), 81.5, 61.1, 14.6; MS (EI) m/z 319 ( ${ }^{+}, 34$ ), 165
(54), 137 (26), 120 (100), 69 (37); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{6} 319.080435$, found 319.081014.

## General Procedure U. 4-(6-Hydroxy-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carbox-

 amido)benzoic acid (211, DMA-NB74-83). A mixture of 205 ( $40.0 \mathrm{mg}, 0.125 \mathrm{mmol}$ ) in a LiOH solution ( $2.0 \mathrm{~mL}, 1.0 \mathrm{M}$ ) was stirred at room temperature for 2.5 h . The reaction mixture was acidified with an aqueous HCl solution $(1.0 \mathrm{M}, \mathrm{pH}=1-2)$ at $0^{\circ} \mathrm{C}$ and the resultant carboxylic acid product precipitated. The solid was isolated by vacuum filtration, washed with deionized water ( 15 mL ) and dried in vacuo to afford 211 as a white solid ( $32.0 \mathrm{mg}, 88 \%$ ): $\mathrm{Mp}>380^{\circ} \mathrm{C}$; IR (ATR) 3245, 3038, 2855, 1718, 1671, 1592, 1528, 1414, 1254, 1174, $798 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 17.17(\mathrm{~s}, 1 \mathrm{H}), 12.85(\mathrm{~s}, 1 \mathrm{H}), 11.79(\mathrm{~s}, 3 \mathrm{H}), 7.95(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz})$, 7.66 (d, $2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz}$ ); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 169.3,167.2$ (3 C), 149.0, 140.9, 131.1 (2 C), 127.3, 120.6 (2 C), 81.7; MS (EI) m/z 291 ( $\mathrm{M}^{+}, 18$ ), 154 (34), 137 (100), 120 (79), 68 (35); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{12} \mathrm{H}_{9} \mathrm{~N}_{3} \mathrm{O}_{6} 291.049135$, found 291.048553.

Benzyl 6-(methylthio)-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (216, DMA-NB74-6). To a suspension of $\mathrm{K}_{2} \mathrm{CO}_{3}(2.55 \mathrm{~g}, 18.5 \mathrm{mmol})$ in DMSO ( 20 mL ) was added dibenzyl malonate ( $2.91 \mathrm{~mL}, 13.0 \mathrm{mmol}$ ) followed by 3,3-dimethylthio-2-azaprop-2-enenitrile ( 1.50 g ,
9.23 mmol ). The reaction mixture was stirred at room temperature for 5 h and was then slowly added to an ice cold HCl solution ( $50 \mathrm{~mL}, 10 \%$ ). A white precipitate formed. After stirring for 15 min , the precipitate was isolated by filtration, washed with deionized water ( 30 mL ) and recrystallized from a 4:1 mixture of EtOH:water ( 50 mL ). The resulting crude product was recrystallized a second time from a 9:1 mixture of EtOAc: $\mathrm{EtOH}(65 \mathrm{~mL})$ to afford $\mathbf{2 1 6}$ as a clear crystalline solid (921 mg, 34\%): Mp 215-216 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3453, 3030, 1718, 1650, 1411, 1273, $1130 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 300 \mathrm{MHz}\right) \delta 11.37(\mathrm{~s}, 1 \mathrm{H}), 10.94(\mathrm{~s}, 1 \mathrm{H}), 7.45-7.31(\mathrm{~m}$, $5 \mathrm{H}), 5.21(\mathrm{~s}, 2 \mathrm{H}), 2.55(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} \mathrm{~d}_{6}, 75 \mathrm{MHz}\right) \delta 163.9,159.4,158.9,149.7$, 135.9, 128.3 (2 C), 127.9, 127.8 (2 C), 104.3, 66.1, 14.3; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{SNa}(\mathrm{M}+\mathrm{Na}) 315.0415$ found 315.0414.

## 217

Ethyl 6-(methylthio)-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (217, DMA-
NB74-7). To a suspension of $\mathrm{K}_{2} \mathrm{CO}_{3}(3.40 \mathrm{~g}, 24.6 \mathrm{mmol})$ in DMSO ( 27 mL ) was added diethyl malonate ( $2.70 \mathrm{~mL}, 17.2 \mathrm{mmol}$ ) followed by 3,3-dimethylthio-2-azaprop-2-enenitrile ( 2.00 g , 12.3 mmol ). The reaction mixture was stirred at room temperature for 5 h and was then added to deionized water ( 125 mL ) and acidified $(\mathrm{pH}=0.5)$ by the slow addition of an HCl solution $(\sim 21$ $\mathrm{mL}, 10 \%)$. A precipitate formed after cooling to $0{ }^{\circ} \mathrm{C}$ for 15 min and was removed by filtration. The filtrate was neutralized with $\mathrm{KOH}(\mathrm{pH}=7)$ and a white solid slowly formed over 15 h . The solid was isolated by filtration and was dissolved in an aqueous HCl solution ( $15 \mathrm{~mL}, 10 \%$ ) for 15 min . A white solid precipitated which was isolated by vacuum filtration, washed with water ( 30 mL ) and recrystallized from EtOAc ( 20 mL ) to afford 217 as a clear crystalline solid (522
mg, 18\%): Mp 237-238.5 ${ }^{\circ}$ C; IR (ATR) 3453, 3157, 3019, 2824, 1713, 1687, 1647, 1480, 1405, 1285, 1103, $1021 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 300 \mathrm{MHz}\right) \delta 11.35(\mathrm{~s}, 1 \mathrm{H}), 10.94(\mathrm{~s}, 1 \mathrm{H}), 4.17(\mathrm{q}$, $2 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}), 2.55(\mathrm{~s}, 3 \mathrm{H}), 1.22(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta 164.3$, 159.9, 157.7, 150.2, 105.8, 61.2, 14.8, 14.5; MS (EI) m/z 230 ( ${ }^{+}$, 7), 184 (33), 125 (22), 111 (29), 97 (53), 83 (54), 69 (88), 57 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}$ 230.036129, found 230.036411.
218

6-(Methylthio)-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxylic acid (218, DMA-NB74-

## 14) and tert-butyl 6-(methylthio)-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate

 (219). To a suspension of $\mathrm{K}_{2} \mathrm{CO}_{3}(1.70 \mathrm{~g}, 12.3 \mathrm{mmol})$ in DMSO $(15 \mathrm{~mL})$ was added ditert-butyl propane-1,3-dioate ( $2.70 \mathrm{~mL}, 7.69 \mathrm{mmol}$ ) followed by 3,3-dimethylthio-2-azaprop-2-enenitrile $(1.00 \mathrm{~g}, 6.15 \mathrm{mmol})$. The reaction mixture was stirred at room temperature for 18 h and was then added in small portions to an aqueous HCl solution ( $30 \mathrm{~mL}, 10 \%$ ). A precipitate formed which was isolated by vacuum filtration, washed with water ( 40 mL ) and stirred in boiling EtOAc (100 mL). An insoluble white solid was filtered from the EtOAc solution. The filtrate was concentrated and recrystallized three times from a minimum amount of boiling EtOAc to afford 219 as a fluffy white solid ( $41.6 \mathrm{mg}, 3.0 \%$ ): Mp 327-328 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3381, 3151, 3038, 1718, 1696, 1642, 1528, 1299, $1118 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}\right.$, 300 MHz ) $\delta 11.29(\mathrm{~s}, 1 \mathrm{H})$, 10.90 (s, 1 H ), 2.56 ( $\mathrm{s}, 3 \mathrm{H}$ ), $1.45(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} \mathrm{~d}_{6}, 75 \mathrm{MHz}\right) \delta 162.7,159.6,155.0$, 149.9, 107.4, 81.4, 27.7 (3 C), 14.3; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{SNa}$ 281.0572,found 281.0574. The solid isolated from the filtration was purified by solid/liquid extraction using EtOAc (4 X 60 mL ) to afford 218 as a white crystalline solid ( $450 \mathrm{mg}, 36 \%$ ): Mp 329$330{ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3276, 3120, 1713, 1612, 1511, 1374, $1174 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO- $\mathrm{d}_{6}$, 300 MHz ) $\delta 13.85(\mathrm{~s}, 1 \mathrm{H}), 12.18(\mathrm{~s}, 1 \mathrm{H}), 10.90(\mathrm{~s}, 1 \mathrm{H}), 2.58(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75\right.$ $\mathrm{MHz}) \delta 169.8,166.5,164.9,148.7,96.7,14.7$; MS (EI) $\mathrm{m} / \mathrm{z} 202\left(\mathrm{M}^{+}, 0.7\right), 158$ (76), 115 (11), 68 (100); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}$ 202.004829, found 202.004120.

General procedure V. Benzyl 6-(methylsulfinyl)-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5carboxylate (220, DMA-NB74-16). To a suspension of 216 (292 mg, 1.00 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 20 mL ) was added $m$-CPBA ( $591 \mathrm{mg}, 2.50 \mathrm{mmol}, 73 \%$ ) at room temperature. After 15 min , the suspension cleared and after 30 min a white solid precipitated from the reaction mixture. After 1.5 h , the white precipitate was isolated by vacuum filtration, washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ and dried in vacuo to afford 220 as a fluffy white solid ( $247 \mathrm{mg}, 80 \%$ ): Mp 204-205 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3524, 3038, 1739, 1715, 1681, 1666, 1394, 1301, $1124 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} \mathrm{~d}_{6}, 300 \mathrm{MHz}\right) \delta$ 11.67 (s, 1 H ), 10.34 ( $\mathrm{s}, 1 \mathrm{H}$ ), 7.46-7.33 (m, 5 H ), 5.27 ( s, 2 H ), 2.93 (s, 3 H ); ${ }^{13}$ C-NMR (DMSO$\mathrm{d}_{6}, 75 \mathrm{MHz}$ ) $\delta 168.0,163.5,159.8,148.9,136.2,128.9$ (2 C), 128.5, 128.3 (2 C), 101.4, 66.8, 41.4; HRMS (ESI) $m / z$ calculated for $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{SNa}(\mathrm{M}+\mathrm{Na})$ 331.0365, found 331.0388.

221

Ethyl 6-(methylsulfinyl)-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (221, DMA-NB74-21). According to general procedure V, 217 ( $150 \mathrm{mg}, 0.651 \mathrm{mmol}$ ) and m-CPBA (385 $\mathrm{mg}, 1.63 \mathrm{mmol}, 73 \%$ ) were mixed in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(13 \mathrm{~mL})$ at room temperature for 1.5 h . The product was precipitated from the reaction mixture at $0{ }^{\circ} \mathrm{C}$ with hexanes ( 10 mL ) and the resulting solid was isolated by vacuum filtration, washed with a $1: 1$ mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes ( 10 mL ) and dried in vacuo to afford 221 as a clear crystalline solid ( $115 \mathrm{mg}, 72 \%$ ): Mp 239$240{ }^{\circ} \mathrm{C}$; IR (ATR) 3174, 3055, 2831, 1735, 1705, 1674, 1592, 1400, 1314, 1120, $1006 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 11.64(\mathrm{~s}, 1 \mathrm{H}), 10.31(\mathrm{~s}, 1 \mathrm{H}), 4.21(\mathrm{q}, 2 \mathrm{H}, J=6.9 \mathrm{~Hz}), 2.96(\mathrm{~s}, 3$ H), $1.25(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 167.2,163.4,159.8,148.9,101.7$, 61.6, 41.4, 14.5; MS (EI) m/z 246 (M+ 30), 200 (25), 155 (52), 140 (87), 112 (100), 94 (31); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}$ 246.031043, found 246.031121.

General Procedure W. Benzyl 6-(4-(ethoxycarbonyl)phenylamino)-2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (224, DMA-NB74-19). A suspension of 220 (200 mg, 0.649 mmol ) and ethyl 4-aminobenzoate ( $1.03 \mathrm{~g}, 6.17 \mathrm{mmol}$ ) in dioxane ( 2.0 mL ) was heated to $95-100{ }^{\circ} \mathrm{C}$ for 6 h . A white solid precipitated from the reaction mixture during this time. The
reaction mixture was cooled to room temperature, diluted with acetone ( 1.0 mL ) and further cooled to $0{ }^{\circ} \mathrm{C}$ for 30 min . The cold reaction mixture was vacuum filtered and the isolated white solid was washed with acetone ( 5.0 mL ) and dried in vacuo to afford 224 as a white crystalline solid (202 mg, 76\%): Mp 379-380 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3381, 3230, 3038, 1718, 1696, 1642, 1528, 1299, $1118 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 300 \mathrm{MHz}\right) \delta 11.08$ (s, 1 H ), 11.01 (s, 1 H ), 10.80 (s, 1 H ), 7.97 (d, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), 7.48-7.44 (m, 4 H ), 7.39-7.30 (m, 3 H ), 5.24 (s, 2 H ), 4.32 (q, $2 \mathrm{H}, J=6.9 \mathrm{~Hz}), 1.32(\mathrm{t}, 3 \mathrm{H}, J=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}, 75 \mathrm{MHz}\right) \delta 168.3,165.7,161.0$, 156.8, 149.6, 141.2, 137.1, 131.0 (2 C), 128.7 (2 C), 128.0, 127.7 (2 C), 127.6, 124.8 (2 C), 83.1, 65.5, 61.2, 14.7; MS (EI) m/z 409 ( $\mathrm{M}^{+}, 7$ ), 365 (24), 301 (13), 275 (23), 256 (33), 91 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{6} 409.127386$, found 409.127861.

4-(5-(Ethoxycarbonyl)-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-ylamino)benzoic acid (206, DMA-NB74-25). According to general procedure W, 221 ( $50.0 \mathrm{mg}, 0.203 \mathrm{mmol}$ ) and 4aminobenzoic acid (264 mg, 1.90 mmol ) were heated in dioxane $(1.0 \mathrm{~mL})$ at $95-100{ }^{\circ} \mathrm{C}$ for 5 h . The resulting product 206 was isolated as a light white solid ( $32.1 \mathrm{mg}, 50 \%$ ): $\mathrm{Mp}>380{ }^{\circ} \mathrm{C}$; IR (ATR) 3217, 3172, 1743, 1705, 1666, 1634, 1575, 1420, 1301, 1204, $788 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 12.94(\mathrm{~s}, 1 \mathrm{H}), 11.02(\mathrm{~s}, 2 \mathrm{H}), 10.73(\mathrm{~s}, 1 \mathrm{H}), 7.95(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz})$, 7.41 (d, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), $4.15(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 1.22(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ (DMSO-
$\left.\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta 168.5,167.3,161.0,156.6,149.6,141.0,131.1$ (2 C), 128.4, 124.5 (2 C), 83.3, 60.3, 14.8; MS (EI) m/z 319 (M ${ }^{+}$, 11), 273 (100), 163 (19), 91 (25), 57 (36); HRMS (EI) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{6} 319.080435$, found 319.080744.

General procedure X. 6-(4-(Ethoxycarbonyl)phenylamino)-2,4-dioxo-1,2,3,4-tetrahydro-pyrimidine-5-carboxylic acid (207, DMA-NB74-27). To a solution of 224 ( $25.0 \mathrm{mg}, 0.0611$ $\mathrm{mmol})$ in a 1:1 mixture of dioxane: $\mathrm{MeOH}(15 \mathrm{~mL})$ was added $20 \mathrm{wt} \% \mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(10.7 \mathrm{mg}$, $0.020 \mathrm{mmol} / \mathrm{Pd}$ ). The dark back suspension was placed under a $\mathrm{H}_{2}$ atmosphere ( 1 atm ). The reaction mixture was stirred for 3 h and filtered through a plug of celite (1.5 in, disposable pipette) with EtOAc ( 50 mL ). The filtrate was concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$ and the resulting white solid was purified by warming in a 3:1 solution of EtOAc:hexane ( 10 mL ) for 15 min. The solid was isolated by vacuum filtration, washed with hexanes ( 10 mL ) and dried in vacuo to afford 207 as a white crystalline solid (14.2 mg, 73\%): Mp 324.5-326 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3161, 2991, 2823, 1722, 1681, 1625, 1575, 1390, 1286, $1128 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}\right.$, $300 \mathrm{MHz}) \delta 14.52$ (s, 1 H ), 11.68 (s, 1 H ), 11.59 (s, 1 H ), 11.52 (s, 1 H ), 8.00 (d, $2 \mathrm{H}, \mathrm{J}=8.4$ $\mathrm{Hz}), 7.52(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 4.33(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 1.33(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 169.5,168.5,165.7,157.0,148.8,139.9,131.0$ (2 C), 128.6, 125.8 (2 C),

Benzyl 4-aminobenzoate (225, DMA-NB74-77). ${ }^{90}$ To a solution of 4-aminobenzoic acid (3.00 $\mathrm{g}, 21.9 \mathrm{mmol})$ in $\mathrm{MeOH}(50 \mathrm{~mL})$ was added $\mathrm{Cs}_{2} \mathrm{CO}_{3}(3.92 \mathrm{~g}, 12.0 \mathrm{mmol})$. The reaction mixture was stirred at room temperature for 30 min , concentrated by rotary evaporation $\left(40^{\circ} \mathrm{C}\right)$ and dried in vacuo. The resulting cesium salt was suspended in a $3: 1$ solution of $\mathrm{CH}_{3} \mathrm{CN}(30 \mathrm{~mL})$ : DMF $(10 \mathrm{~mL})$ and a solution of benzyl bromide ( $2.73 \mathrm{~mL}, 23.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{3} \mathrm{CN}(10 \mathrm{~mL})$ was added dropwise over 2 h . The reaction mixture was stirred at room temperature for 17 h , concentrated by rotary evaporation ( $40^{\circ} \mathrm{C}$ ) and the resulting crude yellow oil was dissolved in EtOAc (150 mL ). The EtOAc solution was washed with a saturated $\mathrm{NaHCO}_{3}$ solution (1 X 50 mL ), followed by a saturated brine solution ( 1 X 50 mL ). The EtOAc layer was dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, concentrated by rotary evaporation $\left(40^{\circ} \mathrm{C}\right)$ and the resulting yellow oil was recrystallized from a 10:1 solution of hexanes:EtOAc ( 150 mL ) to afford 225 as a fluffy white solid ( $2.23 \mathrm{~g}, 45 \%$ ): Mp 87-88 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3453, 3354, 3222, 1681, 1631, 1597, 1277, 1169, 1114, $1075 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 7.67(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 7.43-7.32(\mathrm{~m}, 5 \mathrm{H}), 6.57(\mathrm{~d}, 2 \mathrm{H}, J=8.7$ Hz ), 6.31 (s, 2 H ), 5.48 (s, 2 H ); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 166.1,154.1,137.3,131.7$ (2 C), 128.9 (2 C), 128.3, 128.2 (2 C), 116.0, 113.1 (2 C), 65.5; MS (EI) m/z 227 ( ${ }^{+}, 54$ ), 182 (17), 120 (100), 91 (94); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{NO}_{2}$ 227.094629, found 227.094483.

General procedure Y. Ethyl 4-(2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-ylamino)benzoate (227, DMA-NB74-57). A mixture of 6-chloro-1,3-dihydropyrimidine-2,4-dione (220 mg, 1.50 mmol) and ethyl 4-aminobenzoate ( $991 \mathrm{mg}, 6.00 \mathrm{mmol}$ ) was heated to $155-160{ }^{\circ} \mathrm{C}$ for 3 h . The solids melted during heating forming a clear solution. After 3 h , the reaction mixture was cooled to room temperature, diluted with acetone $(4.0 \mathrm{~mL})$ and stirred for 30 min . The remaining solid was isolated by vacuum filtration and washed with acetone ( 10 mL ). The resulting solid was boiled in EtOAc ( 30 mL ) for 30 min and the mixture was cooled to room temperature. The purified solid was isolated by vacuum filtration, washed with acetone ( 10.0 mL ) and dried in vacuo to afford 227 as a white solid (299 mg, 72\%): Mp 363-365 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3086, 3014, 1716, 1683, 1647, 1485, 1407, 1260, $1127 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 300 \mathrm{MHz}\right.$ ) $\delta 10.64$ (s, 1 H), 10.36 (s, 1 H), 8.79 (s, 1 H), 7.92 (d, $2 \mathrm{H}, ~ J=8.7 \mathrm{HZ}$ ), 7.26 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 4.98 (s, $1 \mathrm{H}), 4.27(\mathrm{q}, 2 \mathrm{H}, J=6.9 \mathrm{~Hz}), 1.29(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta 165.2$, 164.4, 150.8, 150.6, 143.2, 130.9 (2 C), 124.2, 120.0 (2 C), 78.9, 60.5, 14.2; MS (EI) m/z 275 $\left(\mathrm{M}^{+}, 100\right), 247$ (6), 120 (32), 69 (41), 57 (53); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{4}$ 275.090606, found 275.090923.

Benzyl 4-(2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-ylamino)benzoate (228, DMA-NB74-55). According to general procedure Y, 225 ( $1.39 \mathrm{~g}, 6.12 \mathrm{mmol}$ ) and 6-chloro-1,3-dihydropyrimidine-2,4-dione ( $225 \mathrm{mg}, 1.54 \mathrm{mmol}$ ) were dissolved in DMF ( 1.0 mL ) and heated to $155-160{ }^{\circ} \mathrm{C}$ for 1 h. The reaction mixture was worked up according to the general procedure. The isolated product was further purified by dissolving in DMSO (10 mL) and adding distilled water ( 20 mL ) slowly to re-precipitate the product. The resulting solid was isolated by vacuum filtration, boiled in EtOAc ( 10 mL ) for 5 min to remove residual DMSO, re-isolated by vacuum filtration, washed with hexanes ( 15 mL ) and dried in vacuo to afford 228 as a pale yellow solid ( $98.7 \mathrm{mg}, 19 \%$ ): Mp 301-303 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3194, 3086, 2932, 1752, 1711, 1592, 1560, 1267, 1101, 751 $\mathrm{cm}^{-1}{ }^{1}{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 10.64(\mathrm{~s}, 1 \mathrm{H}), 10.37(\mathrm{~s}, 1 \mathrm{H}), 8.82(\mathrm{~s}, 1 \mathrm{H}), 7.95(\mathrm{~d}, 2 \mathrm{H}$, $J=8.4 \mathrm{~Hz}), 7.46-7.37(\mathrm{~m}, 5 \mathrm{H}), 7.27(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 5.32(\mathrm{~s}, 2 \mathrm{H}), 4.98(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 165.5,164.9,151.3,151.1,143.9,136.7,131.3$ (2 C), 129.0 (2 C), 128.6, 128.4 (2 C), 124.3, 120.5 (2 C), 79.5, 66.4; MS (EI) m/z 337 ( ${ }^{+}$, 25), 187 (12), 146 (18), 91 (100), 65 (17); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}_{4} 337.106256$, found 337.105811.

4-(2,6-Dioxo-1,2,3,6-tetrahydropyrimidin-4-ylamino)benzoic acid (229, DMA-NB74-5). According to general procedure Y, 6-chloro-1,3-dihydropyrimidine-2,4-dione (293 mg, 2.00 mmol ) and 4-aminobenzoic acid ( $1.02 \mathrm{~g}, 7.50 \mathrm{mmol}$ ) were dissolved in DMF ( 1.0 mL ) and heated to $155-160{ }^{\circ} \mathrm{C}$ for 2 h to afford 229 as a light yellow solid ( $352 \mathrm{mg}, 71 \%, \sim 90 \%$ pure by ${ }^{1} \mathrm{H}$-NMR). A 50.0 mg sample was further purified by recrystallization from a $3: 1$ solution of deionized water:DMSO initially heated to $90^{\circ} \mathrm{C}$ then cooled to rt. The recrystallized solid was isolated by vacuum filtration and heated in distilled water for 30 min at $90^{\circ} \mathrm{C}$ two times to remove any residual DMSO. After cooling to room temperature the solid was isolated by vacuum filtration, washed with additional water ( 5.0 mL ) and dried under high vacuum for 24 h . Following the recrystallization, 229 was isolated as a white powder (33.2 mg, 66\% recovery from recrystallization): $\mathrm{Mp}>380{ }^{\circ} \mathrm{C}$; IR (KBr) 3354, 3012, 1719, 1600, 1398, $1276 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 12.79$ (s, 1 H), 10.63 (s, 1 H), 10.35 (s, 1 H), 8.75 (s, 1 H), 7.91 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), $7.26(\mathrm{~d}, 2 \mathrm{H}, J=8.7), 4.97(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 167.3$, 164.9, 151.3 (2 C), 143.2, 131.3 (2 C), 125.9, 120.6 (2 C), 79.0; MS (EI) m/z 247 (M+ 53), 155 (64), 120 (40), 84 (77), 68 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{11} \mathrm{H}_{9} \mathrm{~N}_{3} \mathrm{O}_{4} 247.059306$, found 247.057526.

Benzyl 4-((2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl)(ethoxycarbonyl)amino)benzoate
(230, DMA-NB108-3). To a solution of $228(70.0 \mathrm{mg}, 0.208 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(32.1 \mu \mathrm{~L}, 0.228$ mmol ) in DMF ( 1.0 mL ) was added diethyl pyrocarbonate ( $33.7 \mu \mathrm{~L}, 0.228 \mathrm{mmol}$ ) at $0{ }^{\circ} \mathrm{C}$. The reaction mixture turned a light green color and was warmed to room temperature for 48 h . After 48 h , the reaction mixture was filtered through a 1 in plug of $\mathrm{SiO}_{2}$ (pretreated with a 99.9:0.1 solution of $\mathrm{EtOAc}_{\mathrm{Et}}^{3} \mathrm{~N}$ ) and the product was flushed through with a 99.9:0.1 solution of $\mathrm{EtOAc}: \mathrm{Et}_{3} \mathrm{~N}(85 \mathrm{~mL})$. The filtrate was concentrated by rotary evaporation ( $30{ }^{\circ} \mathrm{C}$ ) and the resulting orange residue was diluted with EtOAc ( 1.0 mL ) followed by hexanes ( 30 mL ) with cooling to $0{ }^{\circ} \mathrm{C}$ for 30 min . The resulting solid was isolated by vacuum filtration, washed with hexanes ( 10 mL ) and dried in vacuo. This crystallization procedure was performed twice to afford 230 ( $15.2 \mathrm{mg}, 16 \%$ crude yield, $\sim 85 \%$ pure by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ). The mother liquors from the previous two recrystallizations were combined, concentrated by rotary evaporation ( $30{ }^{\circ} \mathrm{C}$ ) and the resulting pale yellow oil was diluted with EtOAc $(1.0 \mathrm{~mL})$ followed by hexanes ( 30 mL ) at 0 ${ }^{\circ} \mathrm{C}$. The resulting solid was isolated by vacuum filtration, washed with hexanes ( 5.0 mL ) and dried in vacuo to afford pure 230 as a fluffy off-white solid ( $2.0 \mathrm{mg}, 2.3 \%$ ): Mp 171-172 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3196, 2987, 2789, 1715, 1647, 1591, 1418, 1273, 1223, 1107, $1016 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 11.55(\mathrm{~s}, 1 \mathrm{H}), 11.24(\mathrm{~s}, 1 \mathrm{H}), 8.02(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz}), 7.54(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=$ $8.7 \mathrm{~Hz}), 7.48-7.38(\mathrm{~m}, 5 \mathrm{H}), 5.36(\mathrm{~s}, 3 \mathrm{H}), 4.19(\mathrm{q}, 2 \mathrm{H}, J=6.9 \mathrm{~Hz}), 1.20(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz})$; ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 165.3,164.6,152.4,151.3,150.7,144.2,136.5,130.7$ (2 C),

Benzyl 4-(6-(ethoxycarbonylamino)-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)benzoate (236). To a suspension of 235 ( $55.0 \mathrm{mg}, 0.163 \mathrm{mmol}$ ) in dry THF ( 0.50 mL ) was added a solution of LiHMDS ( $42.2 \mathrm{mg}, 0.245 \mathrm{mmol}$ ) in THF ( 0.75 mL ) at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min upon which time the suspension cleared and ethyl chloroformate ( $17.1 \mu \mathrm{~L}, 0.179 \mathrm{mmol}$ ) was added. The reaction mixture was slowly warmed to room temperature and stirred for 5 h . The product was isolated by column chromatography on $\mathrm{SiO}_{2}$ $\left(E t O A c ; \mathrm{R}_{\mathrm{f}}=0.63\right)$ and recrystallized from a $1: 5$ mixture of EtOAc:hexanes ( 15 mL ) to afford 236 as an off white solid ( $13.1 \mathrm{mg}, 20 \%, \sim 80 \%$ pure by $1 \mathrm{H}-\mathrm{NMR}$ ). This product was used crude for the next step: ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}^{6}, 300 \mathrm{MHz}\right) \delta 11.43(\mathrm{~s}, 1 \mathrm{H}), 9.06(\mathrm{~s}, 1 \mathrm{H}), 8.04(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}$ $=8.1 \mathrm{~Hz}), 7.48-7.34(\mathrm{~m}, 7 \mathrm{H}), 5.88(\mathrm{~s}, 1 \mathrm{H}), 5.38(\mathrm{~s}, 2 \mathrm{H}), 3.81(\mathrm{q}, 2 \mathrm{H}, J=6.9 \mathrm{~Hz}), 1.05(\mathrm{t}, 3 \mathrm{H}$, $J=6.9 \mathrm{~Hz}$.

4-(6-(Ethoxycarbonylamino)-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)benzoic acid (209). According to general procedure $\mathrm{X}, 236(9.0 \mathrm{mg}, 0.0176 \mathrm{mmol}, 80 \%$ pure) and $20 \mathrm{wt} \%$ $\operatorname{Pd}(\mathrm{OH})_{2} / \mathrm{C}(0.7 \mathrm{mg}, 0.0013 \mathrm{mmol} / \mathrm{Pd})$ in distilled THF ( 0.50 mL ) were stirred under a $\mathrm{H}_{2}$ atmosphere (1.0 atm) for 10 h at room temperature. After filtration through celite, the resulting white solid was triturated with a 5:1 mixture of hexanes:EtOAc (10 mL) while cooling to $0{ }^{\circ} \mathrm{C}$. The resulting white solid was isolated by vacuum filtration, washed with hexanes ( 3.0 mL ), and dried in vacuo to afford 209 as a white solid ( $3.4 \mathrm{mg}, 53 \%$, $\sim 87 \%$ pure by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ): Mp 289$290{ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3399, 3214, 2987, 2791, 1755, 1705, 1702, 1639, 1610, 1522, 1377, 1204, $1036 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}, 300 \mathrm{MHz}\right) \delta 13.19(\mathrm{~s}, 1 \mathrm{H}), 11.42(\mathrm{~s}, 1 \mathrm{H}), 9.04(\mathrm{~s}, 1 \mathrm{H})$, 7.99 (d, $2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}), 7.41(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 5.88(\mathrm{~d}, 1 \mathrm{H}, J=1.8 \mathrm{~Hz}), 3.97(\mathrm{q}, 2 \mathrm{H}, J=6.9$ $\mathrm{Hz}), 1.06(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 175 \mathrm{MHz}\right) \delta 166.8,163.1,152.5,150.5$, 147.4, 138.3, 131.2, 130.2 (2 C), 129.9 (2 C), 92.7, 61.5, 14.1; MS (EI) $m / z 319$ (M ${ }^{+}$, 29), 273 (88), 230 (93), 188 (82), 68 (73), 53 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{6}$ 319.080435, found 319.079582.

Sodium 3-(4-(ethoxycarbonyl)phenyl)-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-olate (237). A sodium ethoxide solution was freshly prepared by dissolving Na ( $280 \mathrm{mg}, 12.2 \mathrm{mmol}$ ) in distilled EtOH ( 10 mL ) under a nitrogen atmosphere. This solution was cooled to $0{ }^{\circ} \mathrm{C}$ and then 231 ( $1.00 \mathrm{~g}, 4.80 \mathrm{mmol}$ ) was added. The heterogeneous solution was stirred at room temperature for 30 min and upon clearing, diethyl malonate ( $0.729 \mathrm{~mL}, 4.80 \mathrm{mmol}$ ) was added. The homogenous reaction mixture was refluxed for 13 h , a white precipitate formed and the reaction mixture was cooled to room temperature. The reaction mixture was diluted with EtOH ( 5.0 mL ) and acidified to a $\mathrm{pH}=6.0-7.0$ with a concentrated HCl solution. The solvent was removed by rotary evaporation ( $60{ }^{\circ} \mathrm{C}$ ) and the product was dissolved in boiling EtOH ( 100 mL ). The remaining inorganic solids were removed by vacuum filtration and the filtrate was concentrated by rotary evaporation ( $40^{\circ} \mathrm{C}$ ). The resulting clear oil was crystallized by boiling in acetone ( 75 mL ) for 15 min and the resulting solid was isolated by vacuum filtration, washed with acetone ( 50 mL ) and dried in vacuo to afford 237 as a white solid ( $743 \mathrm{mg}, 49 \%$ ): ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO- $\mathrm{d}_{6}$, $300 \mathrm{MHz}) \delta 9.30(\mathrm{~s}, 1 \mathrm{H}), 7.91(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 7.22(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 4.32(\mathrm{q}, 2 \mathrm{H}, J=$ $7.2 \mathrm{~Hz}), 3.96(\mathrm{~d}, 1 \mathrm{H}, J=2.1 \mathrm{~Hz}), 1.31(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta$ 166.0, 164.5, 164.3, 152.9, 143.1, 130.7 (2 C), 129.2 (2 C), 128.3, 75.4, 61.1, 14.7.

Ethyl 4-(2,4,6-trioxotetrahydropyrimidin-1(2H)-yl)benzoate (238, DMA-NB74-61). ${ }^{\mathbf{1 1 2}}$ To а solution of 237 ( $250 \mathrm{mg}, 0.838 \mathrm{mmol}$ ) in distilled water ( 3.0 mL ) was slowly added an aqueous HCl solution ( $1.0 \mathrm{M}, \mathrm{pH}=1.5$ ) dropwise over a 15 min period at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 30 min . The resulting precipitate was isolated by vacuum filtration, washed with deionized water ( 10 mL ) and dried in vacuo to afford 238 as a white solid ( $184 \mathrm{mg}, 79 \%$ ): Mp 224-225 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3252, 3086, 2987, 1702, 1687, 1411, 1275, $1100 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 11.58(\mathrm{~s}, 1 \mathrm{H}), 8.05(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 7.40(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 4.34$ $(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.74(\mathrm{~s}, 2 \mathrm{H}), 1.33(\mathrm{t}, 3 \mathrm{H}, J=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75 \mathrm{MHz}\right) \delta$ 167.6 (2 C), 166.2, 152.3, 140.3, 130.8, 130.7 (2 C), 130.5 (2 C), 61.9, 15.1 (1 C in DMSO peak); MS (EI) m/z 276 ( $\mathrm{M}^{+}, 23$ ), 248 (24), 231 (55), 163 (37), 146 (100), 84 (53); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{5}$ 276.074622, found 276.074522.

4-(2,4,6-Trioxotetrahydropyrimidin-1(2H)-yl)benzoic acid (239, DMA-NB74-62). According to general procedure $\mathrm{U}, 237(225 \mathrm{mg}, 0.641 \mathrm{mmol})$ and an aqueous solution of $\mathrm{LiOH}(2.0 \mathrm{~mL}$,
2.0 M) were combined at room temperature for 2 h to afford 239 as a white crystalline solid (120 mg, 75\%): Mp 303-304 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3390, 3219, 3086, 1716, 1690, 1685, 1606, 1351, 1204, $1114 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}\right.$, 300 MHz ) $\delta 13.11$ (s, 1 H ), 11.55 (s, 1 H ), 8.01 (d, $2 \mathrm{H}, \mathrm{J}$ $=8.1 \mathrm{~Hz}), 7.35(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 3.73(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}, 75 \mathrm{MHz}\right) \delta 167.2(2 \mathrm{C})$, 167.1, 151.8, 139.5, 131.2, 130.3 (2 C), 129.8 (2 C), (1 C in DMSO peak); MS (EI) m/z 248 (M ${ }^{+}$, 45), 220 (15), 163 (100), 146 (70), 90 (23); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{11} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}_{5}$ 248.043322, found 248.042989.

Ethyl 4-(5-(ethylcarbamoyl)-6-hydroxy-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)benzoate (240, DMA-NB74-96). To a solution of $238(60.0 \mathrm{mg}, 0.217 \mathrm{mmol})$ in acetonitrile ( 1.5 mL ) was added $\mathrm{Et}_{3} \mathrm{~N}(46.3 \mu \mathrm{~L}, 0.326 \mathrm{mmol})$ followed by ethanisocyanate ( $\left.18.8 \mu \mathrm{~L}, 0.239 \mathrm{mmol}\right)$. The reaction mixture was stirred at room temperature for 5 h , cooled to $0{ }^{\circ} \mathrm{C}$ and acidified with an aqueous HCl solution $(1.0 \mathrm{M}, \mathrm{pH} 2)$ over a 10 min . The product precipitated and the mixture was stirred at $0^{\circ} \mathrm{C}$ for an additional 30 min . The precipitated product was isolated by vacuum filtration, washed with deionized water ( 5.0 mL ), dried in vacuo and recrystallized from a $3: 1$ mixture of hexanes:EtOAc (10 mL) to afford 240 as a fluffy white solid (33.8 mg, 45\%): Mp $241-242{ }^{\circ} \mathrm{C}$; IR (ATR) 3209, 3086, 3002, 2829, 1718, 1709, 1685, 1592, 1446, 1282, $1096 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 17.43(\mathrm{~s}, 1 \mathrm{H}), 11.83(\mathrm{~s}, 1 \mathrm{H}), 9.69(\mathrm{~s}, 1 \mathrm{H}), 8.03(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=$

4-(5-(Ethylcarbamoyl)-6-hydroxy-2,4-dioxo-3,4-dihydropyrimidin-1(2H)-yl)benzoic acid (210, DMA-NB108-1). According to general procedure U, $240(23.8 \mathrm{mg}, 0.0685 \mathrm{mmol})$ and an aqueous LiOH solution ( $0.50 \mathrm{~mL}, 2.0 \mathrm{M}$ ) were combined at room temperature for 2 h to afford 210 as a pale yellow crystalline solid (10.1 mg, 46\%): Mp 296-297 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3576, 3496, 3151, 2993, 2851, 1675, 1575, 1457, 1413, 1282, 1169, $1094 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}\right.$, $300 \mathrm{MHz}) \delta 17.42$ (s, 1 H ), 13.13 (s, 1 H ), 11.82 (s, 1 H ), 9.69 (s, 1 H ), 8.01 (d, $2 \mathrm{H}, J=8.1 \mathrm{~Hz}$ ), 7.43 (d, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), $3.39(\mathrm{~m}, 2 \mathrm{H}), 1.13(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}\right.$, 75 $\mathrm{MHz}) \delta 170.3,167.2$ (3 C), 149.4, 139.2, 131.1, 130.1 (4 C), 79.7, 35.0, 14.9; MS (EI) m/z 319 ( ${ }^{+}, 74$ ), 275 (21), 248 (15), 163 (100), 146 (83), 137 (46), 69 (44), 57 (45); HRMS (EI) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{6}$ 319.080435, found 319.079829.

### 4.4.2 Second generation analogues of SID 861574: Synthesis of $N_{1}, N_{3}$-differentially-substituted-5-methylene-6-hydroxy uracils.

Phenylmethyl 4-(aminocarbonylamino)benzoate (242). A solution of 225 ( $1.25 \mathrm{~g}, 5.50 \mathrm{mmol}$ ) in $\mathrm{AcOH}(12.5 \mathrm{~mL})$ was stirred at room temperature for 5 min until all of the amine dissolved. A solution of KOCN ( $669 \mathrm{mg}, 8.25 \mathrm{mmol}$ ) in distilled water ( 6.25 mL ) was then added at room temperature and the resulting clear homogenous solution was warmed to $70^{\circ} \mathrm{C}$ for 15 h . The resulting suspension was cooled to room temperature, diluted with water ( 10 mL ) and further cooled to $0{ }^{\circ} \mathrm{C}$ for 30 min . The precipitate was isolated by vacuum filtration, washed with water ( 30 mL ), dried in vacuo and recrystallized by dissolving in boiling EtOAc ( 50 mL ) and slowly adding hexanes ( 50 mL ) followed by cooling to $0^{\circ} \mathrm{C}$ for 30 min . The product was isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo to afford 242 as a white crystalline solid (1.15 g, 78\%): Mp 196.5-197.5 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3440, 3308, 3202, 1705, 1655, 1580, 1530, 1265, $1109 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 8.98(\mathrm{~s}, 1 \mathrm{H}), 7.86(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=$ $8.7 \mathrm{~Hz}), 7.53(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz}), 7.46-7.34(\mathrm{~m}, 5 \mathrm{H}), 6.05(\mathrm{~s}, 2 \mathrm{H}), 5.30(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 165.8,156.0,145.9,136.9,130.9$ (2 C), 129.0 (2 C), 128.5, 128.4 (2 C), 122.0, 117.3 (2 C), 66.1; MS (EI) m/z 270 ( ${ }^{+}$, 9), 163 (23), 120 (49), 91 (100), 65 (73); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{15} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3} 270.1004$, found 270.1008.

Benzyl 4-(3-(ethoxycarbonyl)ureido)benzoate (243, DMA-NB139-67). To a solution of 242 ( $550 \mathrm{mg}, 2.03 \mathrm{mmol}$ ) in THF ( 20 mL ) was added, at $-78{ }^{\circ} \mathrm{C}$, a solution of LiHMDS ( 418 mg , $2.42 \mathrm{mmol}, 0.48 \mathrm{M}$ ) in THF, dropwise over 5 min . The mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 30 min and then ethyl cyanoformate ( $0.219 \mathrm{~mL}, 2.24 \mathrm{mmol}$ ) was added. The reaction mixture was slowly warmed to $0{ }^{\circ} \mathrm{C}$ over 5 h and was quenched by the addition of a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 10 mL ) with stirring for 20 min . The mixture was diluted with EtOAc ( 50 mL ) and washed with a saturated $\mathrm{NaHCO}_{3}$ solution ( 1 X 50 mL ). The EtOAc layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated in vacuo and the yellow residue was chromatographed on $\mathrm{SiO}_{2}$ (2:1 hexanes:EtOAc). The isolated product was recrystallized from a $10: 1$ solution of hexane:EtOAc ( 40 mL ) to afford 243 as a light yellow crystalline solid ( $438 \mathrm{mg}, 63 \%$ ): Mp $156-157{ }^{\circ} \mathrm{C}$; IR (ATR) 3239, 3133, 2969, 1726, 1694, 1593, 1549, 1505, 1273, 1241, $1090 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 10.47(\mathrm{~s}, 1 \mathrm{H}), 10.12(\mathrm{~s}, 1 \mathrm{H}), 7.95(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.66(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=$ $9.0 \mathrm{~Hz}), 7.47-7.34(\mathrm{~m}, 5 \mathrm{H}), 5.32(\mathrm{~s}, 2 \mathrm{H}), 4.18(\mathrm{q}, 2 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}), 1.24(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR (DMSO- $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 165.0,154.4,150.2,142.4,136.2,130.4$ (2 C), 128.4 (2 C), 128.0, 127.9 (2 C), 124.1, 118.8 (2 C), 65.9, 61.7, 14.1; MS (EI) $m / z 342$ ( ${ }^{+}, 26$ ), 235 (42), 146 (42), 91 (100); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{5} 342.1216$, found 342.1202.

Phenylmethyl 4-(2,4,6-trioxo-1,3,5-trihydropyrimidinyl)benzoate (245, DMA-NB166-38). To a solution of malonyl dichloride ( $804 \mu \mathrm{~L}, 8.55 \mathrm{mmol}$ ) in distilled THF ( 55.0 mL ) was added $242(1.10 \mathrm{~g}, 4.07 \mathrm{mmol})$ at room temperature. The homogeneous light yellow reaction mixture was stirred for 5 min and then DIPEA ( $744 \mu \mathrm{~L}, 4.27 \mathrm{mmol}$ ) was added. After 2 h , the reaction mixture was diluted with a saturated brine solution (150 mL) and extracted with DCM (2 X 150 mL ). The extracts were combined, filtered through a 1 in plug of $\mathrm{SiO}_{2}$, washed through the plug with excess EtOAc ( 250 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo. The resulting orange solids were dissolved in boiling EtOAc ( 25 mL ) and hexanes ( 150 mL ) were slowly added to precipitate the product. After cooling to $0^{\circ} \mathrm{C}$, the solid was isolated by vacuum filtration, washed with hexanes ( 50 mL ) and dried in vacuo to afford 245 as a yellow/orange crystalline solid (532 mg, 39\%): Mp 220.5-222.0 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3194, 3101, 2881, 1694, 1423, 1360, 1273, $1114 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{DMSO}_{\mathrm{d}}^{6}, 300 \mathrm{MHz}\right) \delta 11.60(\mathrm{~s}, 1 \mathrm{H}), 8.10(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=7.8 \mathrm{~Hz})$, 7.49-7.35 (m, 7 H), 5.39 (s, 2 H ), 3.75 ( $\mathrm{s}, 2 \mathrm{H}$ ); ${ }^{13} \mathrm{C}$ NMR (DMSO-d ${ }_{6}, 175 \mathrm{MHz}$ ) $\delta 167.1$ (2 C), 165.5, 151.8, 140.0, 136.5, 130.3 (2 C), 130.1 (2 C), 130.0, 129.0 (2 C), 128.6, 128.4 (2 C), 66.8, 40.8; MS (EI) m/z 338 ( ${ }^{+}$, 8), 231 (27), 146 (23), 91 (100), 65 (44); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{18} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{5}$ 338.0903, found 338.0902.

Phenylmethyl 4-(4-ethoxycarbonyloxy-2,6-dioxo-1,3-dihydropyrimidinyl)benzoate (246).
To a homogeneous light orange solution of 245 ( $150 \mathrm{mg}, 0.443 \mathrm{mmol}$ ) in THF ( 5.0 mL ) was added ethyl chloroformate ( $48.1 \mu \mathrm{~L}, 0.488 \mathrm{mmol})$ followed by $\mathrm{Et}_{3} \mathrm{~N}(68.5 \mu \mathrm{~L}, 0.488 \mathrm{mmol})$ at 0 ${ }^{\circ} \mathrm{C}$. The reaction mixture turned heterogeneous and dark orange upon the addition of $\mathrm{Et}_{3} \mathrm{~N}$, was warmed to room temperature over 1 h , stirred at room temperature for 2 h , diluted with distilled water ( 5.0 mL ) and acidified to a pH of $3-4$ with an HCl solution ( $1.0 \mathrm{M}, \sim 4$ drops). The acidified mixture was then diluted with DCM ( 50 mL ) and washed with a saturated brine solution (2 X 50 mL ). The DCM layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, vacuum filtered through a 1 in plug of $\mathrm{SiO}_{2}$, washed through the plug with 3:1 EtOAc:hexanes ( 250 mL ) and concentrated by rotary evaporation ( $30^{\circ} \mathrm{C}$ ). The residue was triturated with a $3: 1$ solution of DCM:hexanes ( 75 mL ), cooled to $0{ }^{\circ} \mathrm{C}$ for 15 h and the remaining solids were isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo to afford 246 as a light yellow solid (117 mg, 64\%): Mp 209.5-211.0 ${ }^{\circ} \mathrm{C}$ (dec); IR (ATR) 3183, 3096, 2969, 2831, 1787, 1713, 1644, 1260, 1196, 1103, $1016 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 12.43(\mathrm{~s}, 1 \mathrm{H}), 8.08(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 7.50-$ $7.36(\mathrm{~m}, 7 \mathrm{H}), 5.82(\mathrm{~s}, 1 \mathrm{H}), 5.39(\mathrm{~s}, 2 \mathrm{H}), 4.33(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 1.31(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}),{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 165.1,163.0,154.4,149.9,149.5,139.7,136.1,129.9$ (2 C), 129.7 (2 C), 129.5, 128.6 (2 C), 128.2, 127.9 (2 C), 89.5, 66.4 (2 C), 13.9; MS (EI) m/z 410 (M ${ }^{+}, 100$ ),

338 (67), 303 (24), 146 (9), 91 (26); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{21} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{7} 410.1114$, found 410.1113.

4-(4-Ethoxycarbonyloxy-2,6-dioxo-1,3-dihydropyrimidinyl)benzoic acid (247). To a solution of 246 ( $50.0 \mathrm{mg}, 0.122 \mathrm{mmol}$ ) in distilled THF ( 3.0 mL ) was added $20 \mathrm{wt} \% \mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(17.1$ $\mathrm{mg}, 0.0240 \mathrm{mmol}$ ) and the reaction mixture was placed under a hydrogen ( 1 atm ) atmosphere at room temperature for 2 h . At this time, the reaction mixture was directly filtered through a 1 in plug of $\mathrm{SiO}_{2}$, washed through with additional EtOAc ( 35 mL ) and dried by rotary evaporation ( $25^{\circ} \mathrm{C}$ ). The resulting light yellow solid was triturated with a 2:1 solution of hexanes:EtOAc (25 mL ), isolated by vacuum filtration, washed with hexanes ( 10 mL ), triturated a second time with acetone ( $1.0 \mathrm{~mL}, 0^{\circ} \mathrm{C}, 5 \mathrm{~min}$ ), filtered and dried in vacuo to afford 247 as a white powdery solid (23.7 mg, 61\%): Mp 210-211 ${ }^{\circ} \mathrm{C}$ (dec); IR (ATR) 3075, 2969, 2825, 2674, 1787, 1694, 1649, 1423, 1260, 1185, $1016 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{DMSO}_{6}$, 300 MHz ) $\delta 13.12(\mathrm{~s}, 1 \mathrm{H}), 12.42(\mathrm{~s}, 1 \mathrm{H})$, 8.01 (d, $2 \mathrm{H}, J=8.1 \mathrm{~Hz}$ ), $7.42(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 5.81(\mathrm{~s}, 1 \mathrm{H}), 4.33(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 1.32$ (t, $3 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 167.2,163.5,154.9,150.4,150.0,139.6$, 131.1, 130.3 (2 C), 129.8 (2 C), 89.8, 66.8, 14.3; MS (EI) m/z 320 ( $\mathrm{M}^{+}, 11$ ), 248 (43), 163 (100), 146 (71); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{7} 320.0645$, found 320.0650 .

Ethyl 2-[ $N$-( $N$-\{4-[benzyloxycarbonyl]phenyl\}carbamoyl)carbamoyl]acetate (251, DMA-
NB205-51). To a solution of ethyl malonyl chloride ( $186 \mu \mathrm{~L}, 1.20 \mathrm{mmol}$ ) in THF ( 7.0 mL ) was added 242 ( $270 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) in one portion at room temperature. The resulting dark orange suspension cleared after 5 h . After 20 h , the reaction mixture was directly filtered through a 1 in plug of $\mathrm{SiO}_{2}$ and flushed through with EtOAc ( 75 mL ). The filtrate was concentrated in vacuo and the resulting orange solids were dissolved in boiling EtOAc ( 20 mL ) to which hexanes (80 mL ) was slowly added to precipitate the product. After slowly cooling to room temperature and then to $0^{\circ} \mathrm{C}$ for 30 min , the precipitate was isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo to afford methyl 251 as light yellow crystalline needles (300 mg, 78\%): Mp 136.5-137.5 C ; IR (ATR) 3233, 3120, 2982, 1750, 1694, 1599, 1554, 1506, 1273, 1247, 1154, 1096, $1021 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 10.62(\mathrm{~s}, 1 \mathrm{H}), 10.00(\mathrm{~s}, 1 \mathrm{H}), 8.06$ (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), $7.60(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.46-7.35(\mathrm{~m}, 5 \mathrm{H}), 5.36(\mathrm{~s}, 2 \mathrm{H}), 4.25(\mathrm{q}, 2 \mathrm{H}, \mathrm{J}=$ 7.2 Hz), $3.52(\mathrm{~s}, 2 \mathrm{H}), 1.31(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 167.8,167.4$, 166.1, 150.8, 141.5, 136.2, 131.2 (2 C), 128.8 (2 C), 128.4 (3 C), 126.1, 119.6 (2 C), 66.9, 62.5, 42.5, 14.2; MS (EI) m/z 384 (M ${ }^{+}$, 57), 277 (27), 146 (100), 91 (80); HRMS (EI) m/z calculated for $\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{6}$ 384.1321, found 384.1323.

Phenylmethyl 4-[5-(ethoxycarbonyl)-4-hydroxy-2,6-dioxo-1,3-dihydropyrimidinyl]benzoate (248, DMA-NB205-60). To a pale yellow solution of $251(150 \mathrm{mg}, 0.390 \mathrm{mmol})$ in DCM (8.0 $\mathrm{mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}(114 \mu \mathrm{~L}, 0.820 \mathrm{mmol})$ followed by CDI ( $94.8 \mathrm{mg}, 0.585 \mathrm{mmol}$ ) at room temperature. The reaction mixture was stirred for 36 h , diluted with deionized water ( 5.0 mL ), acidified to a pH of 1.5 with an HCl solution $(1.0 \mathrm{M})$ and then diluted with $\mathrm{DCM}(30 \mathrm{~mL})$. The aqueous layer was removed and the DCM layer was washed with an HCl solution (30 ml deionized water, 2 drops of 1.0 M HCl$)$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation $\left(20^{\circ} \mathrm{C}\right)$. The resulting tan solids were dissolved in EtOAc ( 20 mL ) and hexanes ( 60 mL ) were added to precipitate the product. After cooling to $0^{\circ} \mathrm{C}$ for 30 min , the resulting solid was isolated by vacuum filtration, washed with hexanes ( 20 mL ) and dried in vacuo to afford 248 as a light tan solid (106 mg, 66\%): Mp 214-216 C (dec); IR (ATR) 3164, 2982, 1737, 1681, 1605, 1517, 1415, 1277, 1150, 1105, $1005 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 12.50(\mathrm{~s}, 1 \mathrm{H}), 8.07$ (d, $2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}), 7.50-7.36(\mathrm{~m}, 7 \mathrm{H}), 5.39(\mathrm{~s}, 2 \mathrm{H}), 4.27(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 1.24(\mathrm{t}, 3 \mathrm{H}, J=$ 7.2 Hz); ${ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 75 \mathrm{MHz}\right) \delta 171.7,168.5,165.6,160.1,149.3,140.4,136.6,130.4$ (2 C), 130.2 (2 C), 129.8, 129.0 (2 C), 128.6, 128.4 (2 C), 83.1, 66.8, 61.9, 14.5; MS (EI) $\mathrm{m} / \mathrm{z}$ $410\left(\mathrm{M}^{+}, 2\right), 364$ (57), 257 (88), 231 (57), 146 (78), 91 (100); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{21} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{7} 410.1114$, found 410.1100 .

## 4-[5-(Ethoxycarbonyl)-4-hydroxy-2,6-dioxo-1,3-dihydropyrimidinyl]benzoic acid

(249, DMA-NB205-71). To a solution of 248 ( $50.0 \mathrm{mg}, 0.122 \mathrm{mmol}$ ) in THF ( 3.0 mL ) was added $\mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(17.0 \mathrm{mg}, 0.0244 \mathrm{mmol})$ at room temperature. The resulting dark black suspension was stirred under hydrogen (1 atm) for 3 h and was then filtered through a plug of $\mathrm{SiO}_{2}$ (1 in, $53 / 4$ in disposable glass pipette) with EtOAc ( 40 mL ). The filtrate was concentrated by rotary evaporation ( $25^{\circ} \mathrm{C}$ ) and the resulting solids were dried in vacuo to afford $\mathbf{2 4 9}$ as a light tan powder (32.3 mg, 83\%): Mp 241-242 ${ }^{\circ} \mathrm{C}$ (dec); IR (ATR) 3233, 3101, 2974, 2894, 1750, 1718, 1694, 1592, 1474, 1424, 1379, 1286, 1228, $1165 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta$ $13.09(\mathrm{~s}, 1 \mathrm{H}), 12.41(\mathrm{~s}, 1 \mathrm{H}), 8.00(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 7.37(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 4.27(\mathrm{q}, 2 \mathrm{H}, J$ $=6.9 \mathrm{~Hz}), 1.24(\mathrm{t}, 3 \mathrm{H}, J=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 171.7,168.4,167.3,160.2$, 149.4, 139.9, 130.9, 130.2 (2 C), 130.1 (2 C), 83.2, 61.9, 14.5; MS (EI) m/z 320 (M ${ }^{+}, 4.5$ ), 303 (42), 274 (20), 163 (57), 146 (63), 91 (76), 69 (80), 57 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{7}$ 320.0645, found 320.0633.

Benzyl 4-(3-(3-methoxy-3-oxopropanoyl)ureido)benzoate (253). To a solution of methyl malonyl chloride ( $162 \mu \mathrm{~L}, 1.51 \mathrm{mmol}$ ) in THF ( 8.0 mL ) was added $242(370 \mathrm{mg}, 1.37 \mathrm{mmol})$ in one portion at room temperature. The resulting light brown suspension cleared after 5 h at room temperature and a precipitate reformed after 20 h . The reaction mixture was then diluted with EtOAc (10 mL), filtered through a 1 in plug of $\mathrm{SiO}_{2}$, flushed through with EtOAc ( 100 mL ) and concentrated in vacuo. The resulting solids were dissolved in boiling EtOAc ( 20 mL ) and hexanes ( 80 mL ) was slowly added to precipitate the product. After slowly cooling to room temperature and then to $0{ }^{\circ} \mathrm{C}$ for 30 min , the precipitate was isolated by vacuum filtration, washed with hexanes ( 50 mL ) and dried in vacuo to afford 253 as a tan solid ( $467 \mathrm{mg}, 92 \%$ ): Mp 163.5-164.5 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3233, 3144, 3000, 1756, 1731, 1726, 1700, 1599, 1411, 1265, 1236, $1154 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 10.60(\mathrm{~s}, 1 \mathrm{H}), 9.91(\mathrm{~s}, 1 \mathrm{H}), 8.06(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz})$, $7.60(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 7.47-7.35(\mathrm{~m}, 5 \mathrm{H}), 5.36(\mathrm{~s}, 2 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.54(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 167.6,167.4,165.9,150.8,141.2,136.0,131.0$ (2 C), 128.6 (2 C), 128.3, 128.2 (2 C), 125.9, 119.5 (2 C), 66.7, 53.0, 42.3; MS (EI) m/z 370 ( ${ }^{+}$, 15), 263 (13), 146 (77), 91 (100); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{19} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6} 370.1165$, found 370.1174 .

296

Sodium 4-methylbenzenesulfonothioate (296). ${ }^{94}$ To a suspension of para-toluenesulfinic acid sodium salt ( $5.00 \mathrm{~g}, 28.1 \mathrm{mmol}$ ) in anhydrous pyridine ( 30.0 mL ) was added sulfur ( 900 mg , 28.1 mmol ) at room temperature. The initially pale yellow suspension began to clear and a heavy white precipitate formed after 16 h . After 16 h , the reaction mixture was diluted with ether ( 30 mL ) and was stirred at room temperature for 5 min before cooling to $0^{\circ} \mathrm{C}$ for 30 min . The white precipitate was then isolated by vacuum filtration, washed with ether ( 4 X 25 mL ) and dried in vacuo to afford 296 ( $5.43 \mathrm{~g}, 92 \%$ ): ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 7.65$ (d, $2 \mathrm{H}, \mathrm{J}=7.8$ $\mathrm{Hz}), 7.15(\mathrm{~d}, 2 \mathrm{H}, J=7.5 \mathrm{~Hz}), 2.29(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 152.9,138.9,128.6$ (2 C), 124.5 (2 C), 21.3.

254

S,S'-propane-1,3-diyl bis(4-methylbenzenesulfonothioate) (254). ${ }^{94}$ To a suspension of KI ( $19.1 \mathrm{mg}, 0.115 \mathrm{mmol}$ ) and $296(5.00 \mathrm{~g}, 23.8 \mathrm{mmol})$ in $95 \%$ ethanol ( 20 mL ) was added freshly distilled 1,3-dibromopropane ( $1.17 \mathrm{~mL}, 11.5 \mathrm{mmol}$ ) at room temperature. The heterogeneous reaction mixture was heated to reflux for 5 h , cooled to room temperature and diluted with deionized water ( 30 mL ) followed by DCM ( 75 mL ). The DCM layer was removed, washed with a saturated brine solution (2 X 50 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ for 30 min and concentrated by rotary evaporation ( $40^{\circ} \mathrm{C}$ ). The resulting clear oil was dissolved in DCM ( 2.0 mL ) for chromatography on $\mathrm{SiO}_{2}$ (gradient elution 1:1 hexanes:DCM -> DCM). The isolated product fractions were combined, concentrated by rotary evaporation ( $40^{\circ} \mathrm{C}$ ), transferred to a preweighed 10 mL RBF
with DCM ( 2.0 mL ), re-concentrated by rotary evaporation ( $40^{\circ} \mathrm{C}$ ) and dried in vacuo afford 254 as a white crystalline solid ( $3.66 \mathrm{~g}, 73 \%, \sim 95 \%$ pure): ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 7.79$ (d, 4 $\mathrm{H}, J=8.1 \mathrm{~Hz}), 7.36(\mathrm{~d}, 4 \mathrm{H}, J=8.1 \mathrm{~Hz}), 3.01(\mathrm{t}, 4 \mathrm{H}, J=6.9 \mathrm{~Hz}), 2.47(\mathrm{~s}, 6 \mathrm{H}), 2.06(\mathrm{~m}, 2 \mathrm{H}, J=$ $6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 145.2(2 \mathrm{C}), 141.5(2 \mathrm{C}), 130.0(4 \mathrm{C}), 127.1(4 \mathrm{C}), 34.1$ (2 C), 28.1, 21.7 (2 C).

255

Methyl 2-(4-(benzyloxycarbonyl)phenylcarbamoylcarbamoyl)-1,3-dithiane-2-carboxylate (255). To a suspension of $253(450 \mathrm{mg}, 1.22 \mathrm{mmol})$ in $\mathrm{DCM}(12.0 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}$ (423 $\mu \mathrm{L}, 3.04 \mathrm{mmol}$ ) followed by 254 ( $557 \mathrm{mg}, 1.34 \mathrm{mmol}$ ) at room temperature. The reaction mixture cleared and turned light orange within 5 min . After 3 h , the reaction mixture was diluted with DCM (50 mL), washed with a saturated brine solution (2 X 50 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo. The resulting yellow oil was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.5 \mathrm{~mL})$ and chromatographed on $\mathrm{SiO}_{2}$ (gradient elution 3:1 -> 2:1 hexanes:EtOAc). The product fractions were combined and concentrated in vacuo to afford 255 as a white solid ( $540 \mathrm{mg}, 94 \%$ ): Mp $134-135{ }^{\circ} \mathrm{C}$; IR (ATR) 3265, 3226, 3114, 2956, 1694, 1592, 1543, 1260, 1204, 1172, $1109 \mathrm{~cm}^{-1}$; ${ }^{1}{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 10.46$ (br-s, 1 H ), 9.28 (br-s, 1 H ), 8.08 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 7.63 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 7.47-7.34 (m, 5 H ), 5.36 (s, 2 H ), 3.85 (s, 3 H ), 3.11-2.94 (m, 4 H ), 2.102.06 (m, 2 H ); ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 167.6,166.4,165.8,149.6,141.2,136.1,131.0(2$ C), 128.6 (2 C), 128.3, 128.2 (2 C), 126.0, 119.4 (2 C), 66.7, 61.2, 54.6, 28.1 (2 C), 23.4; MS

## Benzyl 4-(7,9,11-trioxo-1,5-dithia-8,10-diazaspiro[5.5]undecan-8-yl)benzoate (256, DMA-

NB166-96). To a suspension of $255(488 \mathrm{mg}, 1.03 \mathrm{mmol})$ in $\mathrm{ACN}(50 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( $157 \mathrm{mg}, 1.13 \mathrm{mmol}$ ) at room temperature. The reaction mixture was heated to reflux for 4 h , cooled to room temperature, diluted with distilled water ( 30 mL ) and acidified with an HCl solution ( $1.0 \mathrm{M}, \mathrm{pH}=2-3$ ). The resulting cloudy solution was diluted with a saturated brine solution ( 150 mL ) and was extracted with EtOAc (2 X 150 mL ). The extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$. The resulting yellow solids were chromatographed on $\mathrm{SiO}_{2}$ (gradient elution 3:1-> 2:1 hexanes:EtOAc) and the product fractions were combined and concentrated in vacuo to afford 256 as white solid ( $306 \mathrm{mg}, 67 \%$ ): Mp $112.0-113.5{ }^{\circ} \mathrm{C}$; IR (ATR) 3220, 3114, 2932, 1694, 1392, 1323, $1265 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right.$, $300 \mathrm{MHz}) \delta 8.61(\mathrm{br}-\mathrm{s}, 1 \mathrm{H}), 8.22(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.1 \mathrm{~Hz}), 7.46-7.27(\mathrm{~m}, 7 \mathrm{H}), 5.40(\mathrm{~s}, 2 \mathrm{H}), 3.36-$ 3.27 (m, 2 H ), 3.18-3.10 (m, 2 H ), 2.19-2.16 (m, 2 H ); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 166.1$, 165.6, 164.7, 148.3, 137.7, 135.9, 131.3, 131.1 (2 C), 128.8 (4 C), 128.5, 128.4 (2 C), 67.3, 52.0, 27.6 (2 C), 23.1; MS (EI) m/z 442 (M ${ }^{+}, 7$ ), 335 (13), 263 (21), 146 (93), 118 (81), 91 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{21} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}_{2}$ 442.065716, found 442.063885 .

Benzyl 4-(10-ethyl-7,9,11-trioxo-1,5-dithia-8,10-diazaspiro[5.5]undecan-8-yl)benzoate (257, DMA-NB205-38). To a clear solution of 256 ( $303 \mathrm{mg}, 0.680 \mathrm{mmol}$ ) in DCM ( 20 mL ) was added $\mathrm{Et}_{3} \mathrm{~N}(474 \mu \mathrm{~L}, 3.40 \mathrm{mmol})$ followed by ethyl chloroformate ( $325 \mu \mathrm{~L}, 3.40 \mathrm{mmol}$ ) dropwise over 25 min at $0{ }^{\circ} \mathrm{C}$. The clear reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 1 h , warmed to room temperature over 30 min and then filtered directly through a 1 in plug of $\mathrm{SiO}_{2}$ and washed through with a 3:1 mixture of hexanes:EtOAc ( 100 mL ). The filtrate was concentrated in vacuo and the resulting white solids were purified by recrystallization from a boiling 2:1 mixture of hexanes:EtOAc ( 30 mL ) followed by cooling to $0{ }^{\circ} \mathrm{C}$ for 15 h . The resulting solid was isolated by vacuum filtration, washed with hexanes ( 15 mL ) and dried in vacuo to afford 257 as a clear crystalline solid (225 mg, 71\%): Mp 161-162 ${ }^{\circ} \mathrm{C}$; IR (ATR) 2974, 1713, 1681, 1398, 1385, 1314, 1273, 1109, $846 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.22(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 7.47-7.31(\mathrm{~m}, 7$ H), $5.40(\mathrm{~s}, 2 \mathrm{H}), 4.00(\mathrm{q}, 2 \mathrm{H}, J=6.9), 3.40-3.31(\mathrm{~m}, 2 \mathrm{H}), 3.15-3.07(\mathrm{~m}, 2 \mathrm{H}), 2.20-2.13(\mathrm{~m}, 2$ H), $1.26(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 165.6(2 \mathrm{C}), 164.9,149.3,138.6$, 135.9, 131.1 (3 C), 128.8 (2 C), 128.7 (2 C), 128.5, 128.3 (2 C), 67.2, 52.6, 38.9, 27.9 (2 C), 23.3, 13.1; MS (EI) $m / z 470\left(\mathrm{M}^{+}, 2\right), 400$ (93), 259 (49), 65 (100); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{23} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}_{2} 470.0970$, found 470.0973 .

Phenylmethyl 4-(3-ethyl-2,4,6-trioxo-1,3,5-trihydropyrimidinyl)benzoate (259, DMA-NB205-58). To a solution of $257(130 \mathrm{mg}, 0.267 \mathrm{mmol})$ in THF ( 2.0 mL ) was added nano-zinc (181 mg, 2.76 mmol ) followed by a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 2.0 mL ). The heterogeneous biphasic black reaction mixture was stirred at room temperature for 45 min , carefully acidified to pH 1.5 with an HCl solution $(1.0 \mathrm{M})$ and then filtered through a plug of celite ( 1 in ) with EtOAc ( 75 mL ). The filtrate was washed with a saturated brine solution (2 X 50 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation $\left(35^{\circ} \mathrm{C}\right)$. The resulting pale yellow oil was re-filtered through a 1 in plug of celite ( 9 in disposable pipette) with EtOAc ( 25 mL ) and the filtrate was concentrated by rotary evaporation ( $20^{\circ} \mathrm{C}$ ). The resulting clear oil was dissolved in DCM (3.0 mL ) and hexanes ( 15 mL ) were added. The cloudy white solution was cooled to $-78{ }^{\circ} \mathrm{C}$ for 30 min and the resulting solid was isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo to afford 259 as a white powdery solid ( $62.8 \mathrm{mg}, 62 \%$ ): Mp 152.5-154.0 ${ }^{\circ} \mathrm{C}$; IR (ATR) 2974, 2894, 1700, 1681, 1398, 1273, 1122, 1228, $1172 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right)$ $\delta 8.22(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 7.43-7.38(\mathrm{~m}, 5 \mathrm{H}), 7.29(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 5.39(\mathrm{~s}, 2 \mathrm{H}), 4.00(\mathrm{q}, 2$ $\mathrm{H}, J=6.9 \mathrm{~Hz}), 3.86(\mathrm{~s}, 2 \mathrm{H}), 1.26(\mathrm{t}, 3 \mathrm{H}, J=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 165.6$, 164.4, 164.2, 150.9, 138.3, 135.9, 131.1 (3 C), 128.9 (2 C), 128.8 (2 C), 128.6, 128.4 (2 C), 67.2, 40.2, 37.9, 13.4; MS (EI) $\mathrm{m} / \mathrm{z} 366$ ( ${ }^{+}$, 58), 259 (93), 146 (88), 91 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{5}$ 366.1216, found 366.1199.

Phenylmethyl 4-[4-(ethoxycarbonyl)-1,3,5-trioxo-7,11-dithia-2,4-diazaspiro[5.5]undec-2yl]benzoate (258, DMA-NB205-59). To a solution of 256 ( $300 \mathrm{mg}, 0.678 \mathrm{mmol}$ ) in dry DCM ( 7.0 mL ) cooled to $0{ }^{\circ} \mathrm{C}$ was added anhydrous pyridine ( $274 \mu \mathrm{~L}, 3.39 \mathrm{mmol}$ ) followed by ethyl chloroformate ( $334 \mu \mathrm{~L}, 3.39 \mathrm{mmol}$ ). The clear reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min and was slowly warmed to room temperature over 30 min . The reaction mixture was then diluted with DCM (50 mL), washed with deionized water (4 X 50 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation $\left(10-15^{\circ} \mathrm{C}\right)$. The resulting pale yellow oil was dissolved in DCM ( 5.0 mL ) and hexanes ( 30 mL ) were added at room temperature. The cloudy solution was then cooled to $-78{ }^{\circ} \mathrm{C}$ under nitrogen for 30 min . A precipitate formed which was isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo to afford 258 as a white powdery solid (317 mg, 91\%): Mp 147.5-148.5 ${ }^{\circ} \mathrm{C}$; IR (ATR) 2987, 1787, 1705, 1694, 1398, 1334, 1273, 1215, 1109, $1008 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.23(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz})$, 7.47-7.33 (m, 7 H ), 5.40 (s, 2 H ), 4.51 (q, $2 \mathrm{H}, J=6.9 \mathrm{~Hz}$ ), 3.27-3.19 (m, 4 H ), 2.21-2.15 (m, 2 H), $1.43(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 165.5,164.8,162.6,148.2,146.6$, 137.5, 135.9, 131.5, 131.2 (2 C), 128.9 (2 C), 128.7 (2 C), 128.6, 128.4 (2 C), 67.3, 67.1, 52.6, 27.8 (2 C), 23.1, 13.9; MS (EI) m/z 514 ( ${ }^{+}, 100$ ), 346 (29), 178 (33), 91 (48); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{24} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{7} \mathrm{~S}_{2} 514.0868$, found 514.0852.

## Ethyl 2,4,6-trioxo-3-\{4-[benzyloxycarbonyl]phenyl\}-1,3,5-trihydropyrimidinecarboxylate

 (244, DMA-NB245-23). To a solution of 258 ( $90.0 \mathrm{mg}, 0.175 \mathrm{mmol}$ ) in THF ( 3.0 mL ) was added nano-zinc (229 mg, 3.50 mmol ) followed by a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 3.0 mL ) at room temperature. The heterogeneous biphasic black reaction mixture was vigorously stirred at room temperature for 2 h and was then slowly acidified to $\mathrm{pH} 1-1.5$ with an HCl solution (1.0 M , the mixture clears and the Zn clumps together near this pH ). The resulting mixture was vacuum filtered through a plug of $\mathrm{SiO}_{2}(1 \mathrm{in})$ with $\mathrm{EtOAc}(100 \mathrm{~mL})$. The filtrate was transferred to a separatory funnel, the water layer was removed, and the EtOAc layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation ( $25^{\circ} \mathrm{C}$ ). The resulting clear oil was re-filtered through a plug of $\mathrm{SiO}_{2}$ with a solution of $\mathrm{EtOAc}(0.10 \% \mathrm{TFA}, 30 \mathrm{~mL})$ and the filtrate was concentrated by rotary evaporation ( $20^{\circ} \mathrm{C}$ ). The clear oil was dissolved in DCM ( 3.0 mL ) and hexanes ( 40 mL ) were slowly added. The turbid solution was cooled to $-5^{\circ} \mathrm{C}$ for 15 h over which time a fluffy white solid crystallized. This solid was isolated by vacuum filtration, washed with hexanes (10 mL ) and dried in vacuo. An attempt to dissolve the white solid in $\mathrm{CDCl}_{3}$ for ${ }^{1} \mathrm{H}$ NMR resulted in a turbid solution in which a small amount of a sticky pale yellow oil did not dissolve. This solution was gravity filtered through a plug of sand ( 0.5 in , contained in a $53 / 4$ in disposable pipette packed tightly with a plug of glass wool) with additional DCM ( 2.5 mL ). The filtrate was concentrated and dried in vacuo $\left(20^{\circ} \mathrm{C}\right)$ to afford 244 as a white powdery solid ( 47.5 mg , 66\%): Mp 140.5-142.0 ${ }^{\circ} \mathrm{C}$; IR (ATR) 2981, 2913, 1787, 1763, 1694, 1411, 1347, 1247, 1215,1191, 1016, 934, $857 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.19(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}), 7.46-7.35$ (m, 5 H ), 7.29 (d, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), 5.38 (s, 2 H ), $4.48(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.87(\mathrm{~s}, 2 \mathrm{H}), 1.40(\mathrm{t}$, $3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 165.5,163.9,162.2,148.7,148.3,137.2,135.8$, 131.3, 131.1 (2 C), 128.8 (4 C), 128.5, 128.3 (2 C), 67.2, 67.0, 39.8, 13.8; MS (EI) m/z $410\left(\mathrm{M}^{+}\right.$, 24), 303 (100); HRMS (EI) $m / z$ calculated for $\mathrm{C}_{21} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{7} 410.1114$, found 410.1112 .

4-[3-(ethoxycarbonyl)-2,4,6-trioxo-1,3,5-trihydropyrimidinyl]benzoic acid (241, DMA-NB205-75). To a solution of $244(53.0 \mathrm{mg}, 0.129 \mathrm{mmol}$ ) in THF ( 3.0 mL ) was added $\mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(18.0 \mathrm{mg}, 0.0256 \mathrm{mmol}, 20 \%)$ and the resulting dark back suspension was placed under hydrogen (1 atm) for 2 h at room temperature. At this time, due to low conversion, a second batch of $\mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}(9.0 \mathrm{mg}, 0.0128 \mathrm{mmol}, 10 \%)$ was added and the reaction went to completion after an additional 2 h . The reaction mixture was directly filtered through a 1 in plug of $\mathrm{SiO}_{2}$ (5 3/4 in disposable pipette, pre-treated once with a 100:0.1 solution of EtOAc:TFA and then flushed with EtOAc ( 10 mL )) with EtOAc ( 45 mL ). The filtrate was condensed by rotary evaporation $\left(25{ }^{\circ} \mathrm{C}\right)$ and the resulting solids were dissolved in EtOAc ( 4.0 mL ). Hexanes were added ( 50 mL ) and the solution was cooled to $0{ }^{\circ} \mathrm{C}$ for 30 min . The resulting precipitate was isolated by vacuum filtration, washed with a 5:1 solution of hexanes:DCM ( 10 mL ), hexanes ( 20 mL ) and dried in vacuo to afford 241 as a white powdery solid (31.8 mg, 77\%): Mp 219-220 ${ }^{\circ} \mathrm{C}$; IR (ATR) 2995, 2900, 2686, 1795, 1756, 1694, 1675, 1385, 1347, 1247, 1215, $1016 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$

NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 13.20(\mathrm{~s}, 1 \mathrm{H}), 8.04(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 7.41(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz})$, $4.41(\mathrm{q}, 2 \mathrm{H}, J=6.9 \mathrm{~Hz}), 3.97(\mathrm{~s}, 2 \mathrm{H}), 1.29(\mathrm{t}, 3 \mathrm{H}, J=6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{\mathrm{d}}, 175\right.$ $\mathrm{MHz}) \delta$ 166.7, 165.1, 164.0, 149.3, 148.9, 138.2, 131.1, 130.0 (2 C), 129.2 (2 C), 65.9, 40.6, 13.6; MS (EI) m/z 320 ( ${ }^{+}, ~ 97$ ), 303 (9), 248 (18), 163 (100), 146 (31); HRMS (EI) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{7}$ 320.0645, found 320.0638.

### 4.4.3 Synthesis and identification of the structure of SID $\mathbf{8 6 1 5 7 4}$

262

Phenylmethyl 4-isocyanatobenzoate (262). To a mixture of 225 ( $600 \mathrm{mg}, 2.64 \mathrm{mmol}$ ) in DCM ( 25 mL ) was added a saturated $\mathrm{NaHCO}_{3}$ solution ( 25 mL ) and the resulting biphasic mixture was vigorously stirred while cooling to $0^{\circ} \mathrm{C}$ over 15 min (ice bath). Stirring was stopped, the layers were allowed to separate and phosgene ( $2.78 \mathrm{~mL}, 5.28 \mathrm{mmol}, 20 \%$ in toluene) was added in a single portion via syringe to the lower organic layer. Stirring was resumed immediately and continued at $0^{\circ} \mathrm{C}$ for 30 min . The reaction mixture was then transferred to a separatory funnel, diluted with distilled water ( 30 mL ) and the aqueous layer was extracted with DCM ( 2 X 60 $\mathrm{mL})$. The DCM extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo to afford 262 as a pale yellow-orange oil ( $658 \mathrm{mg}, 98 \%$ ). This product was used crude for the next step:
${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 8.05(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz}), 7.47-7.36(\mathrm{~m}, 5 \mathrm{H}), 7.15(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7$ $\mathrm{Hz}), 5.37(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 165.6,138.1,135.8,131.3$ (2 C), 128.7 (2 C), 128.4, 128.3 (2 C), 127.5, 125.6, 124.8 (2 C), 67.0.

## Diethyl (2Z)-3-hydroxy-2-(N-\{4-[benzyloxycarbonyl]phenyl\}carbamoyl)pent-2-ene-1,5-

dioate (263, DMA-NB205-79). To a solution of diethyl 3-oxopentane-1,5-dioate (72.7 $\mu \mathrm{L}$, 0.400 mmol ) in dry ether ( 5.0 mL ) was added $\mathrm{NaH}(11.1 \mathrm{mg}, 0.440 \mathrm{mmol})$ in one portion at room temperature. A hydrogen gas release was realized immediately and the initially white suspension cleared after 5 min . The reaction mixture was cooled to $0^{\circ} \mathrm{C}$ and a solution of 262 ( $101 \mathrm{mg}, 0.400 \mathrm{mmol}$ ) in dry ether $(1.0 \mathrm{~mL}$ ) was added dropwise over 5 min . The resulting white suspension was warmed to room temperature over 5 min , heated to reflux for 2.5 h , cooled to room temperature, diluted with distilled water ( 10 mL ) and the resulting suspension was acidified with an HCl solution ( $1.0 \mathrm{M}, \mathrm{pH}=1-1.5$ ). The aqueous layer was extracted with ether ( 2 X 20 mL ). The ether layers were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation ( $25{ }^{\circ} \mathrm{C}$ ). The resulting white solids were dissolved in DCM ( 3.0 mL ) and hexanes ( 30 mL ) were slowly added at room temperature. The resulting cloudy white solution was cooled at $0{ }^{\circ} \mathrm{C}$ for 1 h and a crystalline solid precipitated, which was isolated by vacuum filtration, washed with hexanes ( 40 mL ) and dried in vacuo to afford 263 as clear crystalline needles (112 mg, 61\%): Mp 96-97 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3125, 3070, 2982, 2937, 1718, 1681, 1586, 1530, 1379, 1273, 1172, 1090, $1008 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta 18.20(\mathrm{~s}, 1 \mathrm{H})$, $11.56(\mathrm{~s}, 1 \mathrm{H}), 8.08(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=9.0 \mathrm{~Hz}), 7.64(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz}), 7.48-7.35(\mathrm{~m}, 5 \mathrm{H}), 5.37(\mathrm{~s}, 2$ H), $4.30(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 4.22(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.83(\mathrm{~s}, 2 \mathrm{H}), 1.35(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz})$,
$1.30(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6} \mathrm{~d}_{6}, 75 \mathrm{MHz}\right) \delta 186.6,170.9,168.2,167.8,165.9$, 141.1, 136.1, 130.9 (2 C), 128.6 (2 C), 128.3, 128.2 (2 C), 126.2, 120.5 (2 C), 96.3, 66.7, 61.5, 61.4, 45.5, 14.2, 14.1; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{NO}_{8} \mathrm{Na} 478.1478$, found 478.1448 .

## Ethyl 1-(4-(benzyloxycarbonyl)phenyl)-4,6-dihydroxy-2-oxo-1,2-dihydropyridine-3-

carboxylate (264). To a solution of diethyl 3-oxopentane-1,5-dioate ( $179 \mu \mathrm{~L}, 0.987 \mathrm{mmol}$ ) in distilled THF ( 20 mL ) cooled to $0^{\circ} \mathrm{C}$ was added $\mathrm{NaH}(56.4 \mathrm{mg}, 2.35 \mathrm{mmol}$ ) in one portion. The ice bath was immediately removed and the white suspension was slowly warmed to room temperature over 15 min. At this time, hydrogen gas release ceased and the light suspension was re-cooled to $0{ }^{\circ} \mathrm{C}$ over 10 min . To the reaction mixture was added, dropwise over 5 min , a solution of 262 ( $238 \mathrm{mg}, 0.940 \mathrm{mmol}$ ) in THF ( 2.0 mL ). The ice bath was immediately removed and the heterogeneous reaction mixture was warmed to room temperature over 20 min and to reflux for 2 h . After 2 h , the reaction mixture cleared, became light yellow in color and was cooled to room temperature. To the mixture was then added an HCl solution ( $1.0 \mathrm{M}, 0.50 \mathrm{~mL}$, to quench any un-reacted NaH ) followed by deionized water ( 20 mL ). The biphasic mixture was neutralized (1.0 M HCl, pH 7-8) and then extracted with ether ( 1 X 30 mL ). The aqueous layer was acidified (1.0 M HCl, $\mathrm{pH}=1-1.5$ ) and the resulting cloudy solution was extracted with DCM ( 2 X 50 mL ). The DCM extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo. The resulting light tan solids were recrystallized (2 X) by dissolving in 2-3 mL of DCM
and then slowly adding hexanes ( 20 mL ) with cooling to $0{ }^{\circ} \mathrm{C}$ for 30 min . After each recrystallization, the resulting tan solids were isolated by vacuum filtration, washed with a $2: 1$ mixture of hexanes:DCM ( 20 mL ) and dried in vacuo. The product of the second recrystallization showed 264 ( $149 \mathrm{mg}, 39 \%$, $\sim 92 \%$ pure by ${ }^{1} \mathrm{H}$ NMR): Mp 180.5-182.0 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3082, 2982, 2693, 2441, 1718, 1636, 1586, 1485, 1424, 1334, 1265, 1236, 1103, 1003 $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{DMSO}-\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 13.14$ (s, 1 H ), 11.01 (br-s, 1 H ), 8.06 (d, $2 \mathrm{H}, \mathrm{J}=8.1$ Hz), 7.50-7.35 (m, 7 H ), 5.39 ( $\mathrm{s}, 2 \mathrm{H}$ ), 5.32 ( $\mathrm{s}, 1 \mathrm{H}$ ), 4.18 (q, $2 \mathrm{H}, \mathrm{J}=6.9 \mathrm{~Hz}$ ), 1.21 (t, $3 \mathrm{H}, \mathrm{J}=$ $6.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, 75 \mathrm{MHz}\right) \delta 174.4,172.0,165.6,161.9,160.2,141.3,136.6,130.2$ (2 C), 130.1 (2 C), 129.5, 129.0 (2 C), 128.6, 128.4 (2 C), 89.6, 81.8, 66.8, 60.8, 14.6; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{22} \mathrm{H}_{19} \mathrm{NO}_{7} \mathrm{Na} 432.1059$, found 432.1064.

4-[3-(Ethoxycarbonyl)-4,6-dihydroxy-2-oxohydropyridyl]benzoic acid (260, DMA-NB245-
14). To a clear solution of diethyl 3-oxopentane-1,5-dioate ( $229 \mu \mathrm{~L}, 1.26 \mathrm{mmol}$ ) and ethyl 4isocyanatobenzoate ( $200 \mathrm{mg}, 1.05 \mathrm{mmol}$ ) in distilled THF ( 20 mL ) cooled to $0^{\circ} \mathrm{C}$ was added $\mathrm{NaH}(66.0 \mathrm{mg}, 2.62 \mathrm{mmol})$ in one portion. Hydrogen gas release was noted upon the addition of NaH . The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 30 min and then warmed to room temperature for 30 min . To the heavy white suspension was then added a sodium hydroxide solution (1.0 M, 20 mL ) and the biphasic mixture was vigorously stirred for 1 h at room temperature. The THF layer was removed and the aqueous layer was washed with ether ( 2 X 40 mL ) and acidified with
concentrated HCl to $\mathrm{pH} 0.0-0.5$ at $0^{\circ} \mathrm{C}$. The resulting white suspension was stirred at $0{ }^{\circ} \mathrm{C}$ for an additional 30 min following the acidification and the precipitate was isolated by vacuum filtration, washed with deionized water ( 50 mL ) and dried in vacuo to afford 260 as a white powdery solid (291 mg, 87\%): Mp 225-227 ${ }^{\circ} \mathrm{C}$ (dec); IR (ATR) 3082, 2969, 2863, 2699, 1687, 1644, 1586, 1517, 1498, 1429, 1416, 1273, 1228, $1109 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta$ 13.14 (s, 1 H), 13.00 (br-s, 1 H), 10.84 (br-s, 1 H), 8.00 (d, $2 \mathrm{H}, J=8.4 \mathrm{~Hz}$ ), 7.32 (d, $2 \mathrm{H}, J=8.4$ $\mathrm{Hz}), 5.35(\mathrm{~s}, 1 \mathrm{H}), 4.21(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 1.22(\mathrm{t}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{DMSO}-\mathrm{d}_{6}, 75\right.$ $\mathrm{MHz}) \delta 174.3,171.6,166.9,161.2,159.5,139.9,130.6,129.8$ (2 C), 129.4 (2 C), 90.0, 81.1, 60.6, 14.2; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{15} \mathrm{H}_{13} \mathrm{NO}_{7} \mathrm{Na} 342.0590$, found 342.0583.

### 4.4.4 Synthesis of SID 861574 decomposition products and other related analogues

268

Diprop-2-enyl 3-oxopentane-1,5-dioate (268). A suspension of dimethyl 1,3-acetonedicarboxylate ( $1.00 \mathrm{~mL}, 6.80 \mathrm{mmol}$ ), allyl alcohol ( $4.60 \mathrm{~mL}, 67.1 \mathrm{mmol}$ ) and $\mathrm{ZnO}(280 \mathrm{mg}, 3.40$ $\mathrm{mmol}, 50 \mathrm{~mol} \%$ ) in dry toluene ( 5.0 mL ) was heated to reflux for 27 h . The heterogeneous, pale yellow reaction mixture was cooled to room temperature and then filtered through a 1 in plug of $\mathrm{SiO}_{2}$ with $\mathrm{EtOAc}(75 \mathrm{~mL}$ ). The cloudy white filtrate was concentrated by rotary evaporation (60 ${ }^{\circ} \mathrm{C}$ ) and the oily residue was chromatographed on $\mathrm{SiO}_{2}$ (10:1 hexanes:EtOAc). The product fractions were combined and concentrated in vacuo to afford 268 as a clear oil ( $666 \mathrm{mg}, 43 \%$, 90:10 mixture of keto- to enol- tautomers): IR (ATR) 2995, 2900, 2686, 1795, 1694, 1675, 1385, 1347, $1215 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right)$ keto-tautomer $\delta$ 5.97-5.86 (m, 2 H ), 5.38-5.25 (m, $4 \mathrm{H}), 4.65$ (dt, $4 \mathrm{H}, ~ J=5.7,1.4 \mathrm{~Hz}$ ), 3.66 (s, 4 H ); enol-tautomer $\delta 12.01$ (s, 1 H ), 5.98-5.86 (m,
$2 \mathrm{H}), 5.38-5.25(\mathrm{~m}, 4 \mathrm{H}), 5.19(\mathrm{~s}, 1 \mathrm{H}), 5.47-4.67(\mathrm{~m}, 4 \mathrm{H}), 3.27(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 75$ MHz) keto-tautomer $\delta$ 195.3, 166.6 (2 C), 131.5 (2 C), 119.3 (2 C), 66.4 (2 C), 49.0 (2 C); enoltautomer $\delta$ 172.1, 170.2, 167.8, 132.0, 131.7, 119.0, 118.7, 92.1, 66.2, 65.2, 41.1; HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{5} \mathrm{Na}$ 249.0739, found 249.0749.

4-[4,6-Dihydroxy-2-oxo-3-(prop-2-enyloxycarbonyl)hydropyridyl]benzoic acid (267, DMA-NB245-18). To a clear solution of $268(213 \mathrm{mg}, 0.942 \mathrm{mmol})$ and $203(150 \mathrm{mg}, 0.785 \mathrm{mmol})$ in distilled THF ( 15.0 mL ) cooled to $0^{\circ} \mathrm{C}$ was added $\mathrm{NaH}(49.6 \mathrm{mg}, 1.96 \mathrm{mmol})$ in one portion. Hydrogen gas release was noted upon the addition of NaH and the reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min and then warmed to room temperature for 30 min . To this white suspension was then added a sodium hydroxide solution ( $1.0 \mathrm{M}, 15 \mathrm{~mL}$ ) and the resulting clear biphasic mixture was vigorously stirred for 1 h at room temperature. The THF layer was then removed and the aqueous layer was washed with ether ( 2 X 30 mL ) and acidified with concentrated HCl to pH $0.0-0.5$ at $0{ }^{\circ} \mathrm{C}$. The resulting white suspension was stirred at $0{ }^{\circ} \mathrm{C}$ for an additional 1 h following the acidification. The precipitate was isolated by vacuum filtration, washed with deionized water ( 50 mL ) and dried in vacuo to afford 267 as a white powdery solid ( 208 mg , 80\%): 211-212 ${ }^{\circ} \mathrm{C}$ (dec); IR (ATR) 3088, 2855, 1694, 1636, 1586, 1493, 1424, 1273, 1191, 1103 $\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta 13.01$ (br-s, 2 H ), 10.72 (br-s, 1 H ), 8.00 (d, $2 \mathrm{H}, \mathrm{J}=8.4$
$\mathrm{Hz}), 7.33(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 5.99-5.87(\mathrm{~m}, 1 \mathrm{H}), 5.47-5.36(\mathrm{~m}, 2 \mathrm{H}), 5.19(\mathrm{dd}, 1 \mathrm{H}, J=10.5$, $1.2 \mathrm{~Hz}), 4.67(\mathrm{~d}, 2 \mathrm{H}, J=4.8 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{DMSO}_{6}$, 75 MHz ) $\delta 174.2,171.1,166.9,161.3$, 159.6, 140.0, 132.3, 130.5, 129.8 (2 C), 129.4 (2 C), 117.5, 89.9, 81.0, 64.7; MS (EI) m/z 331 ( $\mathrm{M}^{+}, 82$ ), 273 (24), 163 (47), 137 (93), 69 (100); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{NO}_{7}$ 331.0692, found 331.0695.

4-(4-Hydroxy-2,6-dioxo-1,5-dihydropyridyl)benzoic acid (265, DMA-NB245-24). Tо а white suspension of $267(100 \mathrm{mg}, 0.302 \mathrm{mmol})$ and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(17.4 \mathrm{mg}, 0.0151 \mathrm{mmol}, 0.05$ $\mathrm{mol} \%$ ) in dry THF ( 5.0 mL ) was added morpholine ( $266 \mu \mathrm{~L}, 3.02 \mathrm{mmol}$ ) at room temperature. The resulting heterogeneous light yellow reaction mixture was stirred at room temperature for 1 h. The reaction mixture was then diluted with a NaOH solution ( $1.0 \mathrm{M}, 5.0 \mathrm{~mL}$ ), followed by ether ( 10 mL ) and the organic layer was removed. The pale yellow/orange aqueous layer was washed with ether ( 2 X 10 mL ), cooled to $0^{\circ} \mathrm{C}$ and acidified to $\mathrm{pH} 0.0-0.5$. Upon acidification, a light yellow precipitate formed and the aqueous mixture was cooled to and gently stirred at 0 ${ }^{\circ} \mathrm{C}$ for 30 min . The resulting brown solid was removed by vacuum filtration and the filtrate was immediately extracted with EtOAc (3 X 40 mL ). The extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, vacuum filtered through a 1 in plug of $\mathrm{SiO}_{2}$, flushed through with $\mathrm{EtOAc}(100 \mathrm{~mL})$ and the clear filtrate was concentrated in vacuo. The resulting yellow solids were dissolved in EtOH (15.0 mL ), filtered through a small plug of glass wool and then diluted by slow addition of hexanes
( 100 mL ) at room temperature. The homogeneous pale yellow solution was brought to a boil and concentrated to 75 mL when a light yellow precipitate began to form. At this time, the mixture was slowly cooled to room temperature and then to $-5^{\circ} \mathrm{C}$ for 10 h . The crystallized solid was isolated by vacuum filtration, washed with hexanes ( 10 mL ), dissolved in HPLC grade water ( 8.0 mL ) with heating and the light orange solution was concentrated in vacuo to afford 265 as an orange solid ( $55.1 \mathrm{mg}, 74 \%$ ): $240-245{ }^{\circ} \mathrm{C}$ (slow dec.); IR (ATR) 3459, 3075, 2894, 1694, 1631, 1605, 1392, 1366, 1210, 1165, $1122 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) major tautomer (83\%) $\delta 13.04$ (br-s, 1 H ), 11.78 (br-s, 1 H ), 7.98 (d, $2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}$ ), 7.26 (d, $2 \mathrm{H}, \mathrm{J}=$ 8.4 Hz ), $5.36(\mathrm{~s}, 1 \mathrm{H}), 3.66(\mathrm{~s}, 2 \mathrm{H})$; distinct resonances for minor tautomer (17\%) $\delta 5.25(\mathrm{~s}, 1$ H), 10.43 (s, 1 H ); ${ }^{13} \mathrm{C}$ NMR ( DMSO- $_{6}, 75 \mathrm{MHz}$ ) major tautomer $\delta 168.8,168.5,166.9,166.5$, 139.9, 130.3, 129.7 (2 C), 129.5 (2 C), 93.9, 37.4; MS (EI) m/z 247 ( $\mathrm{M}^{+}, 63$ ), 219 (21), 163 (72), 146 (100), 137 (42), 90 (51), 69 (66); HRMS (EI) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{12} \mathrm{H}_{9} \mathrm{NO}_{5} 247.0481$, found 247.0483; LC/MS/UV data: Phenomenex $\mathrm{C}_{18}(4.6 \mathrm{X} 100 \mathrm{~nm})$ column, $1.0 \mathrm{~mL} / \mathrm{min}, 254 \mathrm{~nm}$, gradient elution with 15 to $45 \%$ acetonitrile in water containing $0.10 \%$ TFA, 1 mg sample $/ \mathrm{mL}$ DMSO or MeOH ; Retention time $=9.96 \mathrm{~min}(\mathrm{MeOH}), 3.29(\mathrm{DMSO}) ; \mathrm{MS}(E S I+) \mathrm{m} / \mathrm{z} 248[\mathrm{M}+$ $\mathrm{H}]^{+}$. This sample was found to have an $\mathrm{IC}_{50}>50 \mu \mathrm{M}$ against PLK1-PBD.

4-(4-Hydroxy-2,6-dioxo-1,5-dihydropyridyl)benzoic acid (265, DMA-NB245-3). To a light yellow solution of $267(20.0 \mathrm{mg}, 0.0557 \mathrm{mmol})$ and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(3.2 \mathrm{mg}, 0.00279 \mathrm{mmol}, 5 \mathrm{~mol} \%)$ in dry THF ( 1.5 mL ) was added morpholine ( $48.2 \mu \mathrm{~L}, 0.557 \mathrm{mmol}, 10$ equiv.) at room temperature. The resulting heterogeneous light orange reaction mixture was stirred at room temperature for 1 h , diluted with an NaOH solution ( $1.0 \mathrm{M}, 2.0 \mathrm{~mL}$ ) and stirred at room temperature for an additional 1.5 h . The resulting light orange mixture was extracted with ether
(3 X 3.0 mL ) and the aqueous layer was cooled to $0{ }^{\circ} \mathrm{C}$ and acidified with an HCl solution $(1.0$ M, pH 0). No precipitate formed upon acidification. The aqueous solution was extracted with EtOAc (4 X 10 mL ) and the EtOAc extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation ( $25{ }^{\circ} \mathrm{C}$ ). The resulting light orange residue was dissolved in EtOAc ( 6.0 mL ) and hexanes ( 30 mL ) was slowly added at room temperature. The resulting orange precipitate was isolated by vacuum filtration, washed with DCM ( 10 mL ) and dried in vacuo to afford 265 ( $9.3 \mathrm{mg}, 68 \%$ ). This sample was found to have an $\mathrm{IC}_{50}=2.079 \mu \mathrm{M}$ against PLK1-PBD in an initial testing and an $\mathrm{IC}_{50}=6.047 \mu \mathrm{M}$ in a follow-up testing.

4-(1-(4-Carboxyphenyl)-4,6-dihydroxy-2-oxo-1,2-dihydropyridine-3-carboxamido)benzoic acid (266, DMA-NB245-67). To a solution of 265 ( $200 \mathrm{mg}, 0.809 \mathrm{mmol}$ ) and 203 ( 155 mg , $0.809 \mathrm{mmol})$ in a $1: 1$ mixture of THF:ACN $(10.0 \mathrm{~mL})$ cooled to $0^{\circ} \mathrm{C}$ was added DIPEA ( 0.270 mL,1.62 mmol, 2 equiv.) in one portion. An orange precipitate formed immediately upon addition of DIPEA and re-dissolved within 3 min . After 5 min , the ice bath was removed. The reaction mixture was warmed to room temperature over 45 min and was then diluted with a 1.0 M NaOH solution ( 10 mL ) to saponify the ethyl ester. After 1.5 h , the deep red aqueous layer was diluted with de-ionized water ( 15 mL ) and extracted with ether ( 3 X 20 mL ). The aqueous layer was cooled to $0{ }^{\circ} \mathrm{C}$, acidified with concentrated $\mathrm{HCl}(\mathrm{pH}=0)$ and the resulting cloudy
purple solution was extracted with EtOAc (4 X 30 mL ). The EtOAc extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation ( $30{ }^{\circ} \mathrm{C}$ ). The resulting solids were recrystallized from a boiling 1:7 mixture of THF:hexanes ( 150 mL ) affording the desired product (188 mg, ~ 80\% pure). This product was further purified by a second recrystallization from a boiling 1:2 mixture of EtOAc:hexanes ( 75 mL ), which was slowly cooled to $-5^{\circ} \mathrm{C}$. The resulting light tan solid was isolated by vacuum filtration, triturated with $\mathrm{MeOH}(5 \mathrm{~mL})$ at $45{ }^{\circ} \mathrm{C}$ for 30 min (to remove EtOAc and hexanes) and concentrated in vacuo to afford 266 solvated with approximately $5 \% \mathrm{MeOH}$ ( $35.3 \mathrm{mg}, 11 \%$ ): Mp 275.0-276.5 ${ }^{\circ} \mathrm{C}$ (dec.); IR (ATR) 3221, 3107, 2887, 2656, 2516, 1719, 1700, 1581, 1536, 1410, 1366, 1254, 1174, $1090 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 14.88$ (br-s, 1 H ), $12.42(\mathrm{~s}, 1 \mathrm{H}), 8.03(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}), 7.89(\mathrm{~d}, 2 \mathrm{H}$, $J=8.7 \mathrm{~Hz}$ ), $7.67(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.41(\mathrm{~d}, 2 \mathrm{H}, J=8.1 \mathrm{~Hz}), 5.39(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO$\mathrm{d}_{6}, 100 \mathrm{MHz}$ ) $\delta 175.2,169.5,166.8$ (2 C), 163.1, 160.8, 141.7, 139.7, 130.7, 130.6 (2 C), 129.9 (2 C), 129.4 (2 C), 125.6, 119.5 (2 C), 89.8, 82.8; LC/MS/UV data: Phenomenex C 18 (4.6 X 100 nm) column, $1.0 \mathrm{~mL} / \mathrm{min}, 254 \mathrm{~nm}$, gradient elution with 15 to $45 \%$ acetonitrile in water containing $0.10 \%$ TFA, 1 mg sample $/ \mathrm{mL}$ DMSO; Retention time $=16.44 \mathrm{~min}$; MS(ESI + ) $\mathrm{m} / \mathrm{z}$ $411[\mathrm{M}+\mathrm{H}]^{+}$.

4-[2-(Ethoxycarbonyl)acetylamino]benzoic acid (271, DMA-NB245-90). ${ }^{113}$ To a solution of ethyl malonylchloride ( $282 \mu \mathrm{~L}, 1.97 \mathrm{mmol}, 90 \%$ ) in dry ether ( 5.0 mL ) was added 4-
aminobenzoic acid ( $250 \mathrm{mg}, 1.82 \mathrm{mmol}$ ) at room temperature. The resulting light orange suspension was stirred at room temperature for 4 h before an additional ( $250 \mathrm{mg}, 1.82 \mathrm{mmol}$ ) of 4-aminobenzoic acid was added. After 20 h , the reaction mixture was diluted with EtOAc (50 $\mathrm{mL})$, extracted with $1.0 \mathrm{M} \mathrm{HCl}(3 \times 50 \mathrm{~mL})$ and brine ( 2 X 50 mL ). The EtOAc layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$ and the resulting orange solids were recrystallized by dissolving in boiling EtOAc ( 40 mL ) to which hexanes ( 5 mL ) were added upon dissolution of the product. After slowly cooling to room temperature, the resulting light orange solid was isolated by vacuum filtration, washed with hexanes ( 20 mL ) and dried in vacuo to afford 271 (309 mg, 63\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 12.74(\mathrm{~s}, 1 \mathrm{H}), 10.49(\mathrm{~s}, 1 \mathrm{H})$, $7.90(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.68(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.12(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.50(\mathrm{~s}, 2 \mathrm{H}), 1.20$ (t, $3 \mathrm{H}, J=7.2 \mathrm{~Hz}$ ); ${ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{DMSO}_{6} \mathrm{~d}_{6}, 100 \mathrm{MHz}\right) \delta 167.6,167.0,164.7,142.9,130.6$ (2 C), 125.5, 118.5 (2 C), 60.8, 43.8, 14.1; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{NO}_{5} \mathrm{Na}$ $(\mathrm{M}+\mathrm{Na})$ 274.0691, found 274.0692.

4-[4-(Ethoxycarbonyl)-3-oxobutanoylamino]benzoic acid (272, DMA-NB245-91). A suspension of ZnO ( $297 \mathrm{mg}, 3.65 \mathrm{mmol}$ ), 261 ( $994 \mu \mathrm{~L}, 5.47 \mathrm{mmol}$ ) and 4-aminobenzoic acid ( $500 \mathrm{mg}, 3.65 \mathrm{mmol}$ ) in dry toluene was prepared at room temperature and heated to reflux for 24 h . At this time, the reaction mixture was cooled to room temperature, diluted with EtOAc (50 $\mathrm{mL})$ and filtered through a plug of $\mathrm{SiO}_{2}(1 \mathrm{in})$ with $\mathrm{EtOAc}(250 \mathrm{~mL})$. The solid remaining on top
of the $\mathrm{SiO}_{2}$ plug was found by ${ }^{1} \mathrm{H}$ NMR (DMSO-d6) to contain the majority of the major product (possibly as the zinc salt). These solids were then carefully removed and triturated with a boiling solution of 50:1 THF:AcOH ( 60 mL ) for 30 min . The hot suspension was vacuum filtered and the filtrate was concentrated in vacuo to afford crude $4-[(1-\{[N-(4-$ carboxyphenyl)carbamoyl]methyl\}-2-(ethoxycarbonyl)vinyl)amino]benzoic acid (olefin position is uncertain) as a white solid ( $160 \mathrm{mg}, \sim 65-70 \%$ pure): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 12.53$ (br-s, 2 H ), 10.41 (s, 1 H ), 8.94 (s, 1 H ), 7.94 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 7.89 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 7.71 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 7.29 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 5.43 (s, 1 H ), 3.99 (s, 2 H ), $3.97(\mathrm{q}, 2 \mathrm{H}, J=7.2$ $\mathrm{Hz}), 1.13(\mathrm{t}, 3 \mathrm{H}, J=7.2 \mathrm{~Hz})$. The remainder of this solid was suspended in a 1.0 M HCl solution ( 20 mL ) and stirred at room temperature for 2 h , at which time the remaining white solid was isolated by vacuum filtration, washed with deionized water ( 20 mL ) , dried in vacuo and suspended in EtOAc ( 2.5 mL ) for chromatography on $\mathrm{SiO}_{2}(\mathrm{EtOAc})$. The product $\left(\mathrm{R}_{\mathrm{f}}=0.66\right.$; $\mathrm{SiO}_{2}$; EtOAc) fractions were combined and concentrated by rotary evaporation ( $40{ }^{\circ} \mathrm{C}$ ). The resulting white solid was dissolved in $\mathrm{MeOH}(10 \mathrm{~mL})$ and re-concentrated in vacuo to afford 272 containing $\sim 2 \%$ of 4 -aminobenzoic acid (15.2 mg, $1 \%$, $\sim 95 \%$ pure): Mp 242-243 ${ }^{\circ} \mathrm{C}$ (dec); IR (ATR) 3334, 3208, 2975, 2667, 2548, 1735, 1683, 1597, 1534, 1409, 1308, 1258, 1169, 1025 $\mathrm{cm}^{-1}$; keto-tautomer (83\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\left.\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 12.71(\mathrm{~s}, 1 \mathrm{H}), 10.42(\mathrm{~s}, 1 \mathrm{H})$, $7.90(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.67(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.10(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.74(\mathrm{~s}, 2 \mathrm{H}), 3.71$ (s, 2 H ), 1.18 (t, $3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}$ ); ${ }^{13} \mathrm{C}$ NMR ( $\mathrm{DMSO}_{6}, 100 \mathrm{MHz}$ ) $\delta$ 198.1, 166.9, 166.8, 165.1, 142.8, 130.5 (2 C), 125.5, 118.4 (2 C), 60.7, 51.6, 49.2, 14.0; distinguished resonances for major-enol-tautomer (13\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta 13.64$ (s, 1 H ), 10.43 (s, 1 H ), 5.37 (s, 1 H), 3.36 (s, 2 H ); distinguished resonances for minor-enol-tautomer (4\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}$,

300 MHz ) $\delta 11.93$ (br-s, 1 H ), 5.25 (s, 1 H ), 3.39 (s, 2 H ); HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{14} \mathrm{H}_{15} \mathrm{NO}_{6} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 316.0797, found 316.0810.

Allyl 1-(4-(ethoxycarbonyl)phenyl)-4,6-dihydroxy-2-oxo-1,2-dihydropyridine-3-carboxylate (274a). To a solution of 268 ( $6.54 \mathrm{~g}, 28.9 \mathrm{mmol}, 1.11$ equiv.) in distilled THF ( 500 mL ) cooled to $0{ }^{\circ} \mathrm{C}$ was added NaH in three 551 mg batches over 5 min ( $1.65 \mathrm{~g}, 65.4 \mathrm{mmol}, 2.5$ equiv.). The ice bath was immediately removed and the resulting white suspension was slowly warmed to room temperature over 30 min. At this time, gas release ceased, the light suspension was recooled to $0^{\circ} \mathrm{C}$ and a solution of $203(5.00 \mathrm{~g}, 26.2 \mathrm{mmol})$ in THF ( 10.0 mL ) was added dropwise over 5 min . The ice bath was immediately removed. The heterogeneous reaction mixture was warmed to room temperature over 30 min and heated to reflux for 2.45 h over which time reaction mixture became orange in color. After cooling to $0^{\circ} \mathrm{C}$, a concentrated HCl solution (reaction mixture $\mathrm{pH} \sim 7-8$, reaction mixture turned deep red upon neutralization) was added to the reaction mixture, followed by deionized water ( 500 mL ) and ether ( 200 mL ). The organic layer was removed and the deep red aqueous layer was extracted with ether ( 2 X 300 mL ). The aqueous layer was then further acidified with an HCl solution $(1.0 \mathrm{M}, \mathrm{pH}=0.5-1.0)$ and the resulting heterogeneous solution was extracted with EtOAc (3 X 300 mL ). The EtOAc layers were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation $\left(30^{\circ} \mathrm{C}\right)$. The resulting
orange/tan solids were triturated with DCM $(100 \mathrm{~mL})$ at room temperature for 15 min . The remaining solids were isolated by vacuum filtration, washed with DCM ( 50 mL ) and hexanes ( 50 mL ), and dried in vacuo to afford a mixture of ~3.5:1:2:trace 274a: 274b: 274c: 274d determined by ${ }^{1} \mathrm{H}$ NMR integration ( $3.23 \mathrm{~g}, 35 \%$ ). The remaining dark red mother liquor was diluted with hexanes ( 250 mL ) and cooled to $-5^{\circ} \mathrm{C}$ for 1 h . The light yellow precipitate was isolated by vacuum filtration, washed with a 1:1 DCM:hexanes solution ( 30 mL ) and hexanes ( 50 mL ), and dried in vacuo to afford a second batch of this crude mixture ( $1.41 \mathrm{~g}, 15 \%$ ). The product mixture was carried on crude to the next step. A LC/MS/ELS analysis was performed (ESI industries epic $\mathrm{C}_{18}$ column; $1.0 \mathrm{~mL} / \mathrm{min} ; 30 \mathrm{~min}$ run; gradient elution $=30$ to $60 \%$ ACN in water, ELS/MS detection). 247a: ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 13.03$ (br-s, 1 H ), 11.89 (br-s, 1 H ), 8.02 (d, $2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.36(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 5.99-5.86(\mathrm{~m}, 1 \mathrm{H}), 5.47-5.41(\mathrm{~m}, 1 \mathrm{H}), 5.35(\mathrm{~s}, 1 \mathrm{H})$, $5.20-5.16(\mathrm{~m}, 1 \mathrm{H}), 4.70(\mathrm{dt}, 2 \mathrm{H}, J=4.8,1.5 \mathrm{~Hz}), 4.35(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 1.34(\mathrm{t}, 3 \mathrm{H}, J=7.2$ Hz); LC/MS (ESI+) m/z 360.2 [M+H] ${ }^{+}$; LC/ELS retention time 12.99 min. 247b: LC/MS (ESI+) m/z $360[\mathrm{M}+\mathrm{H}]^{+}$; LC/ELS retention time $12.99 \mathrm{~min} .247 \mathrm{c}:$ LC/MS (ESI + ) m/z $372[\mathrm{M}+\mathrm{H}]^{+}$; LC/ELS retention time 14.37 min . 247d: LC/MS (ESI + ) m/z $348[\mathrm{M}+\mathrm{H}]^{+}$; LC/ELS retention time 11.53 min .

278

General Procedure for the Optimization Experiments in Table 13. To a solution of heterocycle (25-50 mg) and catalyst (5-100 mol\%) in distilled THF was added the amine (1-10
equiv.) at room temperature. The reaction mixture was stirred at room temperature or heated to the specified temperature for the specified time period. At this time, a NaOH solution (1.0 M, 2.0 mL ) was added to the room temperature reaction mixture. After 2 h , the biphasic mixture was diluted with deionized water ( 15 mL ) and extracted with ether (3 X 20 mL ). The aqueous layer was then cooled to $0^{\circ} \mathrm{C}$ and acidified slowly with a concentrated HCl solution just to pH 0 . The resulting heterogeneous solution was stirred gently at $0{ }^{\circ} \mathrm{C}$ for 30 min , vacuum filtered (filter paper) and the isolated solids were washed with deionized water ( 10.0 mL ). The aqueous filtrate was extracted with EtOAc ( 3 X 20 mL ). The extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo. The crude reaction mixtures were then analyzed by ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}$ or MeOD) and the respective product ratios were reported. Products 277 and 278 were observed in the crude reaction mixtures and their NMR characterization data is reported: 4-(3-Allyl-4-hydroxy-2,6-dioxo-5,6-dihydropyridin-1(2H)-yl)benzoic acid (277). ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 12.89$ (br-s, 1 H ), 11.15 (s, 1 H ), 7.98 (d, $2 \mathrm{H}, \mathrm{J}=8.4 \mathrm{~Hz}$ ), 7.25 (d, 2 H , $J=8.1 \mathrm{~Hz}), 5.82-5.73(\mathrm{~m}, 1 \mathrm{H}), 5.05-4.89(\mathrm{~m}, 2 \mathrm{H}), 3.74(\mathrm{~s}, 2 \mathrm{H}), 3.02(\mathrm{~d}, 2 \mathrm{H}, J=6.6 \mathrm{~Hz})$.

4-(3,3-diallyl-2,4,6-trioxopiperidin-1-yl)benzoic acid (278). ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{MeOH}-\mathrm{d}_{4}, 400 \mathrm{MHz}$ ) $\delta$ 8.11 (d, $2 \mathrm{H}, J=6.3 \mathrm{~Hz}$ ), $7.14(\mathrm{~d}, 2 \mathrm{H}, J=6.3 \mathrm{~Hz}), 5.82-5.72(\mathrm{~m}, 2 \mathrm{H}), 5.20-5.15(\mathrm{~m}, 4 \mathrm{H}), 2.82-$ 2.67 (m, 4 H ); ${ }^{13} \mathrm{C}$ NMR ( $\mathrm{MeOH}-\mathrm{d}_{4}, 100 \mathrm{MHz}$ ) $\delta$ 174.4, 172.2, 167.6, 166.2, 139.7, 131.6 (2 C), 130.6, 130.1 (2 C), 128.7 (2 C), 118.7 (2 C), 54.5, 41.9, 1C in MeOD solvent peak.

282

$\mathbf{2 H}$-Pyran-2,4,6(3H,5H)-trione (282). ${ }^{109,110}$ To a $1.4: 1$ mixture of $\mathrm{AcOH}: \mathrm{Ac}_{2} \mathrm{O}$ (25.8 mL) cooled to $0^{\circ} \mathrm{C}$ was added 1,3-acetonedicarboxylic acid (10.0 g, 66.4 mmol ) portion wise over a

20 min period. The resulting light brown heterogeneous mixture was stirred at $0-5{ }^{\circ} \mathrm{C}$ for 3.5 h . At this time, the white solid was isolated by vacuum filtration, washed with AcOH ( 30 mL ) followed by hexanes ( 100 mL ), and was dried in vacuo to afford $282(6.85 \mathrm{~g}, 81 \%):{ }^{1} \mathrm{H}$ NMR (Acetone-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 10.98(\mathrm{br}-\mathrm{s}, 1 \mathrm{H}), 5.35(\mathrm{~s}, 1 \mathrm{H}), 3.70(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=0.9 \mathrm{~Hz}) ;$ MS (EI) m/z $128\left(\mathrm{M}^{+}, 100\right), 120$ (63), 116 (43).

284

Ethyl 4-(3-oxobutanamido)benzoate (284, DMA-NB245-72). ${ }^{114}$ To a suspension of 282 (1.00 $\mathrm{g}, 7.81 \mathrm{mmol}$ ) in anhydrous ether ( 50 mL ) cooled to $0{ }^{\circ} \mathrm{C}$ was added a solution of ethyl 4aminobenzoate ( $1.32 \mathrm{~g}, 7.81 \mathrm{mmol}$ ) in anhydrous ether ( 25 mL ) dropwise over 30 min . The resulting white suspension was stirred at $0^{\circ} \mathrm{C}$ for 3 h and at room temperature for 16 h affording a pale yellow nearly homogeneous reaction mixture, which was diluted with hexanes ( 50 mL ) and vacuum filtered. The filtrate was cooled to $0^{\circ} \mathrm{C}$ and hexanes ( 125 mL ) was slowly added with stirring. The resulting turbid solution was cooled to $-5^{\circ} \mathrm{C}$ for 40 h over which time a white solid crystallized, which was isolated by vacuum filtration, washed with hexanes ( 50 mL ) and dried in vacuo to afford a nearly 1:1 mixture of 283 and 284 (1.14 g crude, $\sim 50 \%$ ). Compound 283: ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{DMSO}_{\mathrm{d}}^{6}, 300 \mathrm{MHz}\right) \delta 12.69(\mathrm{br}-\mathrm{s}, 1 \mathrm{H}), 10.45(\mathrm{~s}, 1 \mathrm{H}), 7.92(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7$ Hz), $7.70(\mathrm{~d}, 2 \mathrm{H}, J=8.4 \mathrm{~Hz}), 4.28(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.17(\mathrm{~s}, 2 \mathrm{H}), 3.62(\mathrm{~s}, 2 \mathrm{H}), 1.31(\mathrm{t}, 3 \mathrm{H}$, $J=7.2 \mathrm{~Hz}$ ). After storage of the recrystallized solid at room temperature, it was found by ${ }^{1} \mathrm{H}$ NMR that the mixture further decomposed to $\sim 88 \%$ of $\mathbf{2 8 4}$ over 2 d and to $\sim 95 \%$ after 4 d . This
mixture was recrystallized from boiling wet ether ( 100 mL ); however, the purity did not improve. Complete decarboxylation was accomplished by refluxing the mixture in toluene (50 mL ) for 20 min . Concentration of the mixture in vacuo afforded 284 ( $539 \mathrm{mg}, 28 \%$ ): keto tautomer (88\%): ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{DMSO}_{\mathrm{d}}, 300 \mathrm{MHz}\right) \delta 10.40(\mathrm{~s}, 1 \mathrm{H}), 7.91(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz})$, $7.70(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.28(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.60(\mathrm{~s}, 2 \mathrm{H}), 2.21(\mathrm{~s}, 3 \mathrm{H}), 1.31(\mathrm{t}, 3 \mathrm{H}, J=$ 7.2 Hz ); distinguished resonances for enol tautomer (12\%): $\delta 13.61(\mathrm{~s}, 1 \mathrm{H}), 10.24(\mathrm{~s}, 1 \mathrm{H}), 5.23$ (s, 1 H ), 1.94 (s, 3 H ); MS (EI) m/z 249 ( $\mathrm{M}^{+}, 13$ ), 165 (16), 146 (20), 137 (18), 120 (100).

4-(4-Carboxy-3-oxobutanamido)benzoic acid (279, DMA-NB245-70). To a suspension of $282(250 \mathrm{mg}, 1.95 \mathrm{mmol})$ in anhydrous ether $(10 \mathrm{~mL})$ cooled to $0^{\circ} \mathrm{C}$ was added a solution of 4aminobenzoic acid ( $270 \mathrm{mg}, 1.95 \mathrm{mmol}$ ) dissolved in anhydrous ether ( 25 mL ) dropwise over 30. The resulting white suspension was slowly warmed to room temperature for 15 h , vacuum filtered and the resulting white solid was washed with wet ether ( 50 mL ). The crude solids were dissolved in THF ( 20 mL ) at room temperature and hexanes ( 20 mL ) was slowly added. Initially, a pale yellow solid precipitated which was removed by vacuum filtration. The filtrate was diluted with hexanes $(100 \mathrm{~mL})$ and the resulting turbid solution was cooled to $-5^{\circ} \mathrm{C}$ for 3 h . The precipitate was isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo to afford 279 ( $176 \mathrm{mg}, 34 \%, \sim 90 \%$ pure). Product further crystallized from the mother liquor over 16 h at room temperature. The precipitate was isolated by vacuum filtration, washed
with hexanes ( 30 mL ) and dried in vacuo to afford an approximately 94:6 mixture of 279:285 (54.1 mg, 10\%, ~94\% pure) as a white solid: IR (ATR) 3240, 2914, 2675, 2556, 1732, 1668, 1627, 1592, 1428, 1286, 1258, 1174, $940 \mathrm{~cm}^{-1}$; keto tautomer (80\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}, 300$ $\mathrm{MHz}) \delta 12.71(\mathrm{~s}, 1 \mathrm{H}), 10.41(\mathrm{~s}, 1 \mathrm{H}), 7.89(\mathrm{~d}, 2 \mathrm{H}, J=8.0 \mathrm{~Hz}), 7.67(\mathrm{~d}, 2 \mathrm{H}, J=9.0 \mathrm{~Hz}), 3.71$ (s, 2 H ), 3.62 (s, 2 H ); ${ }^{13} \mathrm{C}$ NMR (DMSO-d ${ }_{6}, 75 \mathrm{MHz}$ ) $\delta$ 198.4, 168.4, 166.9, 165.1, 142.8, 130.5 (2 C), 125.4, 118.4 (2 C), 51.6, 49.4; distinguished resonances for major enol tautomer (14\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta 13.6$ (s, 1 H ), 5.38 (s, 1 H ), 3.26 ( $\mathrm{s}, 2 \mathrm{H}$ ); distinguished resonances for minor enol tautomer (6\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta 5.18$ (s, 1 H ), 3.37 (s, 2 H); LC/MS/UV data: Phenomenex $\mathrm{C}_{18}(4.6 \mathrm{X} 100 \mathrm{~nm})$ column, $1.0 \mathrm{~mL} / \mathrm{min}, 254 \mathrm{~nm}$, gradient elution with 15 to $45 \%$ acetonitrile in water containing $0.10 \%$ TFA, 1 mg sample $/ \mathrm{mL}$ DMSO; Retention time $=4.94 \mathrm{~min}$; MS(ESI + ) $\mathrm{m} / \mathrm{z} 266[\mathrm{M}+\mathrm{H}]^{+}$.

4-(3-Oxobutanoylamino)benzoic acid (285, DMA-NB245-77). ${ }^{114}$ A mixture of 279 (127 mg, 0.479 mmol ) in toluene ( 20 mL ) was heated to $110{ }^{\circ} \mathrm{C}$. The decarboxylation experiment was monitored over three heating cycles of $30 \mathrm{~min}(35 \%), 3 \mathrm{~h}(\sim 98 \%)$, and 2.5 h (complete by ${ }^{1} \mathrm{H}$ NMR) for a total heating time of 6 h . The product was isolated and worked up as follows after each heating cycle. Upon cooling to room temperature, the reaction mixture was diluted with hexanes ( 30 mL ), further cooled to $-5{ }^{\circ} \mathrm{C}$ for 1 h and vacuum filtered. The isolated yellow crystalline solid was washed with hexanes ( 20 mL ) and dried in vacuo to afford $285(91.6 \mathrm{mg}$,

86\%): keto tautomer (91\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\left.\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 12.72(\mathrm{~s}, 1 \mathrm{H}), 10.37(\mathrm{~s}, 1 \mathrm{H})$, $7.90(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.68(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 3.60(\mathrm{~s}, 2 \mathrm{H}), 2.21(\mathrm{~s}, 3 \mathrm{H})$; distinguished resonances for enol tautomer (9\%): $\delta 13.63$ (s, 1 H), 10.21 (s, 1 H), 5.23 (s, 1 H), 1.94 (s, 3 H ); MS (EI) m/z 221 ( ${ }^{+}$, 32), 137 (100), 127 (14), 120 (98); LC/UV data: Phenomenex $\mathrm{C}_{18}$ (4.6 X 100 nm ) column, $1.0 \mathrm{~mL} / \mathrm{min}, 254 \mathrm{~nm}$, gradient elution with 15 to $45 \%$ acetonitrile in water containing $0.10 \%$ TFA, 1 mg sample $/ \mathrm{mL}$ DMSO; Retention time $=5.06 \mathrm{~min}$.

Ethyl 4-(5-methoxy-3,5-dioxopentanamido)benzoate (287, DMA-NB245-75). To a suspension of $286(1.35 \mathrm{~mL}, 8.90 \mathrm{mmol})$ and $\mathrm{ZnO}(483 \mathrm{mg}, 5.93 \mathrm{mmol})$ in dry toluene ( 30 mL ) was added ethyl 4-aminobenzoate ( $1.00 \mathrm{~g}, 5.93 \mathrm{mmol}$, 1 equiv.) at room temperature. The white suspension was heated to reflux for 2 h , cooled to room temperature, filtered through a plug of $\mathrm{SiO}_{2}(1 \mathrm{in})$ with EtOAc ( 150 mL ), concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$ and the resulting yellow oil was chromatographed on $\mathrm{SiO}_{2}$ (2:1 hexanes:EtOAc). The product $\left(\mathrm{R}_{\mathrm{f}}=0.20\right)$ fractions were combined, concentrated by rotary evaporation ( $30{ }^{\circ} \mathrm{C}$ ) and the resulting oil was dissolved twice in $\mathrm{MeOH}(8.0 \mathrm{~mL}$ ) followed by re-concentration in vacuo, to aid in the removal of residual EtOAc, to afford 287 as a white crystalline solid (1.15 g, 63\%): Mp 68.5-72.0 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3321, 3195, 3115, 2988, 2956, 1745, 1681, 1594, 1536, 1316, 1279, 1247, 1146, 1003 $\mathrm{cm}^{-1}$; keto tautomer (86\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 10.45(\mathrm{~s}, 1 \mathrm{H}), 7.92(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=$ 8.7 Hz), $7.70(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.28(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.76(\mathrm{~s}, 2 \mathrm{H}), 3.72(\mathrm{~s}, 2 \mathrm{H}), 3.63(\mathrm{~s}, 3$
H), $1.30(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 100 \mathrm{MHz}\right) \delta 198.0,167.3,165.3,165.1$, 143.1, 130.3 (2 C), 124.6, 118.5 (2 C), 60.9, 52.3, 52.0, 49.4, 14.6; distinguished resonances for major enol tautomer (12\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 13.61(\mathrm{~s}, 1 \mathrm{H}), 10.43(\mathrm{~s}, 1 \mathrm{H})$, 5.39 (s, 1 H ), 3.66 (s, 3 H ), $3.39(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{DMSO}_{\mathrm{d}}$, 100 MHz ) $\delta 170.5,169.3,168.7$, 142.8, 119.0, 93.9, 52.4, 41.0; distinguished resonances for minor enol tautomer (2\%): ${ }^{1} \mathrm{H}$ NMR $\left(\right.$ DMSO-d $\left._{6}, 300 \mathrm{MHz}\right) \delta 11.81(\mathrm{~s}, 1 \mathrm{H}), 5.27(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 100 \mathrm{MHz}\right) \delta 171.9$, 171.4, 166.0, 118.2, 91.5, 51.7, 43.5; HRMS (TOF MS ES+) m/z calculated for $\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{NO}_{6} \mathrm{Na}$ $(\mathrm{M}+\mathrm{Na})$ 330.0954, found 330.0953 .

$N$-ethyl-4-(5-morpholino-3,5-dioxopentanamido)benzamide (288, DMA-NB245-82). To а suspension of 287 ( $350 \mathrm{mg}, 1.14 \mathrm{mmol}$ ) and $\mathrm{ZnO}(92.7 \mathrm{mg}, 1.14 \mathrm{mmol})$ in toluene ( 20 mL ) was added morpholine ( $100 \mu \mathrm{~L}, 1.14 \mathrm{mmol}$ ) at room temperature. The resulting mixture was heated to reflux for 36 h , cooled to room temperature and vacuum filtered through a plug of $\mathrm{SiO}_{2}$ (2 in) with EtOAc ( 800 mL ). The cloudy filtrate was concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$ and the resulting light yellow solids were dissolved in EtOAc ( 4.0 mL ) for chromatography on $\mathrm{SiO}_{2}$ (EtOAc). The product fractions $\left(\mathrm{R}_{\mathrm{f}}=0.26\right)$ were combined, concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$ and the resulting light orange oil was dissolved in $\mathrm{MeOH}(5.0 \mathrm{~mL}$, to remove residual EtOAc), re-concentrated by rotary evaporation ( $40{ }^{\circ} \mathrm{C}$ ) and further dried in vacuo to afford 288 as a light orange solid ( $180 \mathrm{mg}, 44 \%$ ). The tautomeric ratios reported below as percentages
reflect the ratio of the tautomer in solution immediately after sample preparation vs. after equilibration (20 h) as measured by ${ }^{1} \mathrm{H}$ NMR integration: Mp 133.5-134.5 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3271, 3195, 3115, 2964, 2869, 1717, 1692, 1592, 1543, 1266, 1234, $1107 \mathrm{~cm}^{-1}$; keto tautomer ( $88 \%$ vs. 80\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 10.45(\mathrm{~s}, 1 \mathrm{H}), 7.92(\mathrm{~d}, 2 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz}), 7.70(\mathrm{~d}, 2 \mathrm{H}, J$ $=8.7 \mathrm{~Hz}), 4.28(\mathrm{q}, 2 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.81(\mathrm{~s}, 2 \mathrm{H}), 3.69(\mathrm{~s}, 2 \mathrm{H}), 3.57-3.52(\mathrm{~m}, 4 \mathrm{H}), 3.46-3.44$ (m, 2 H ), 3.38-3.32 (m, 2 H ), $1.31(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 100 \mathrm{MHz}\right) \delta 199.5$, 165.4, 165.3, 165.2, 143.1, 130.3 (2 C), 124.5, 118.5 (2 C), 66.1, 66.0, 60.5, 51.5, 48.5, 46.1, 41.5, 14.2; distinguished resonances for major enol tautomer ( $0 \%$ vs. $12 \%$ ): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}$, $300 \mathrm{MHz}) \delta 14.97(\mathrm{~s}, 1 \mathrm{H}), 5.62(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.\mathrm{d}_{6}, 100 \mathrm{MHz}\right) \delta 171.2,170.1,166.5$, 143.2, 118.9, 88.7, 43.8; distinguished resonances for minor enol tautomer (12 vs. 8\%): ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 13.68(\mathrm{~s}, 1 \mathrm{H}), 10.37(\mathrm{~s}, 1 \mathrm{H}), 5.31(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d ${ }_{6}, 100$ $\mathrm{MHz}) \delta 170.6,165.8,142.8,93.1,41.5 ;$ HRMS (TOF MS ES+) $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 385.1376, found 385.1368.

4-(5-Morpholino-3,5-dioxopentanamido)benzoic acid (280, DMA-NB245-88). To a homogeneous yellow solution of $\mathbf{2 8 8}$ ( $120 \mathrm{mg}, 0.331 \mathrm{mmol}$ ) in dioxane ( 10 mL ) was added in one portion a 3.0 M LiOH solution ( 10 mL ). The resulting slightly heterogeneous pale yellow reaction mixture was stirred at room temperature for 6 h , cooled to $0{ }^{\circ} \mathrm{C}$ and acidified to pH 0 with a concentrated HCl solution. The resulting pale yellow homogeneous aqueous solution was
extracted with EtOAc ( $4 \times 30 \mathrm{~mL}$ ). The extracts were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$. The resulting yellow residue was triturated with $\mathrm{MeOH}(10 \mathrm{~mL})$ at $40^{\circ} \mathrm{C}$ for 30 min and the heterogeneous solution was cooled to $-5^{\circ} \mathrm{C}$ for 1 h . The precipitate was isolated by vacuum filtration, washed with $\mathrm{MeOH}\left(5 \mathrm{~mL}\right.$, cooled to $0{ }^{\circ} \mathrm{C}$ ) and dried in vacuo to afford 280 as a white solid ( $67.1 \mathrm{mg}, 61 \%$ ). The tautomeric ratios reported below as percentages reflect the ratio of the tautomer in solution immediately after sample preparation vs. after equilibration ( 6 h ) as measured by ${ }^{1} \mathrm{H}$ NMR integration: Mp 177.5-178.5 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3290, 3202, 2975, 2924, 2863, 2662, 2548, 1683, 1596, 1545, 1407, 1314, 1295, 1226, 1169, $1113 \mathrm{~cm}^{-1}$; keto-tautomer ( $90 \%$ vs. $82 \%$ ): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 12.75$ (s, 1 H), $10.43(\mathrm{~s}, 1 \mathrm{H}), 7.90(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.67(\mathrm{~d}, 2 \mathrm{H}, J=8.7 \mathrm{~Hz}), 3.81(\mathrm{~s}, 2 \mathrm{H}), 3.69(\mathrm{~s}, 2$ H), 3.75-3.52 (m, 4 H), 3.46-3.43 (m, 2 H ), 3.38-3.34 (m, 2 H ); ${ }^{13} \mathrm{C}$ NMR (DMSO- $\mathrm{d}_{6}, 100 \mathrm{MHz}$ ) $\delta 199.6,167.0,165.5,165.3,142.9,130.5$ (2 C), 125.5, 118.5 (2 C), 66.1 (2 C), 51.6, 48.5, 46.2, 41.6; distinguished resonances for major-enol-tautomer ( $1 \%$ vs. $11 \%$ ): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}, 300$ $\mathrm{MHz}) \delta 14.98(\mathrm{~s}, 1 \mathrm{H}), 5.62(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 100 \mathrm{MHz}\right) \delta 171.4,170.2,166.5$, 143.0, 118.9, 88.8, 43.9; distinguished resonances for minor-enol-tautomer ( $8 \%$ vs. $7 \%$ ): ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 13.71$ (s, 1 H ), 10.35 (s, 1 H ), 5.31 (s, 1 H ); HRMS (TOF MS ES + ) $m / z$ calculated for $\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 357.1063, found 357.1054; LC/MS/UV data: Phenomenex C ${ }_{18}$ (4.6 X 100 nm ) column, $1.0 \mathrm{~mL} / \mathrm{min}, 254 \mathrm{~nm}$, gradient elution with 15 to $45 \%$ acetonitrile in water containing $0.10 \%$ TFA, 1 mg sample $/ \mathrm{mL}$ DMSO; Retention time $=6.00$ min; MS(ESI+) m/z $375[\mathrm{M}+\mathrm{Na}]^{+}$.

Ethyl 4-(4-\{N-[4-(ethoxycarbonyl)phenyl]carbamoyl\}-3-oxobutanoylamino)benzoate (289,
DMA-NB245-78). To a suspension of dimethyl 1,3-acetonedicarboxylate ( $0.40 \mathrm{~mL}, 2.64 \mathrm{mmol}$ ) and $\mathrm{ZnO}(0.215 \mathrm{mg}, 2.64 \mathrm{mmol})$ in dry toluene ( 12 mL ) was added ethyl 4-aminobenzoate (979 $\mathrm{mg}, 5.81 \mathrm{mmol}, 2.2$ equiv.) at room temperature. The reaction mixture was heated to reflux for 9 $h$, cooled to room temperature and vacuum filtered 3 times through a plug of $\mathrm{SiO}_{2}(1 \mathrm{in})$ with EtOAc ( $\sim 300 \mathrm{~mL} /$ filtration). The cloudy filtrate was condensed by rotary evaporation ( $40{ }^{\circ} \mathrm{C}$ ) after each filtration and this process was repeated until the filtrate was clear. After the third filtration, the resulting white solids were dissolved in boiling EtOAc ( 25 mL ) and diluted with hexanes ( 50 mL ). The turbid solution was slowly cooled to room temperature and the resulting white crystalline solid was isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo. The mother liquor was recrystallized 3 additional time utilizing the same procedure affording 289 ( 701 mg , 60\%, total yield from 4 recrystallizations): Mp 194.0-195.0 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3353, 3295, 3195, 3126, 2975, 1719, 1656, 1599, 1536, 1411, 1273, 1172, $1103 \mathrm{~cm}^{-1}$; keto tautomer (72\%): ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{DMSO}_{\mathrm{d}}\right.$, 300 MHz$) \delta 10.47(\mathrm{~s}, 2 \mathrm{H}), 7.92(\mathrm{~d}, 4 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz})$, $7.71(\mathrm{~d}, 4 \mathrm{H}, J=9.0 \mathrm{~Hz}), 4.28(\mathrm{q}, 4 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.76(\mathrm{~s}, 4 \mathrm{H}), 1.31(\mathrm{t}, 6 \mathrm{H}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR (DMSO- $\left.\mathrm{d}_{6}, 100 \mathrm{MHz}\right) \delta 198.9,165.3$ (2 C), 165.2 (2 C), 143.1 (2 C), 130.3 (4 C), 124.5 (2 C), 118.5 (4 C), 60.5 ( 2 C ), 51.8 (2 C), 14.2 (2 C); distinguished resonances for enol tautomer (28\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\left.\mathrm{d}_{6}, 300 \mathrm{MHz}\right) \delta 13.70$ (s, 1 H ), 10.56 (s, 1 H ), 10.41 (s, 1 H ), 7.75 (d, 2 $\mathrm{H}, J=9.0 \mathrm{~Hz}$ ), $5.42(\mathrm{~s}, 1 \mathrm{H}), 3.40(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{DMSO}_{6}, 100 \mathrm{MHz}\right) \delta 170.8,170.5$,
166.3, 143.2, 142.8, 124.5, 118.9, 118.5, 93.4, 43.4; HRMS (TOF MS ES+) $m / z$ calculated for $\mathrm{C}_{23} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{7} \mathrm{Na}(\mathrm{M}+\mathrm{Na})$ 463.1481, found 463.1440.

4-\{4-[ $N$-(4-carboxyphenyl)carbamoyl]-3-oxobutanoylamino\}benzoic acid (290, DMA-NB245-81). To a solution of $289(200 \mathrm{mg}, 0.454 \mathrm{mmol})$ in dioxane ( 20 mL ) was added a 4.0 M LiOH solution ( 20 mL ) in one portion at room temperature. The resulting heterogeneous yellow reaction mixture was stirred at room temperature for 2.5 h , cooled to $0{ }^{\circ} \mathrm{C}$ and acidified to pH 0 with concentrated $\mathrm{HCl}(10 \mathrm{~mL})$. The resulting white oily suspension was stirred at $0{ }^{\circ} \mathrm{C}$ for 18 h ; however, the suspension did not sufficiently coagulate to afford an isolable solid. The mixture was warmed to room temperature and diluted with deionized water ( 100 mL ) followed by EtOAc $(150 \mathrm{~mL})$ for extraction. A white solid formed between the two layers, was isolated by vacuum filtration, washed with EtOAc ( 20 mL ) and dried in vacuo to afford the product ( 81.7 mg , batch 1). The aqueous layer was extracted with EtOAc ( 3 X 150 mL ). The EtOAc layers were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation $\left(40{ }^{\circ} \mathrm{C}\right)$. The resulting light brown residue was triturated with boiling EtOAc ( 40 mL ) for 30 min . This mixture was cooled to room temperature and the resulting solid was isolated by vacuum filtration, washed with hexanes ( 30 mL ) and dried in vacuo ( 52.7 mg , batch 2 ). ${ }^{1} \mathrm{H}$ NMRs ( $\mathrm{DMSO}-\mathrm{d}_{6}$ ) of both batches of solid showed a similar composition for the isolated products with the major contaminants being residual solvents; dioxane and EtOAc. The products from both batches were combined
and triturated with boiling $\mathrm{MeOH}(50 \mathrm{~mL})$ for 30 min . The white suspension was slowly cooled to room temperature, the resulting light pink solid was isolated by vacuum filtration, washed with $\mathrm{MeOH}(10 \mathrm{~mL})$ and dried in vacuo to afford 290 solvated with $\sim 4 \%$ dioxane ( 118 mg , 68\%): Mp 264.0-265.0 ${ }^{\circ} \mathrm{C}$; IR (ATR) 3303, 3070, 2831, 2667, 2561, 1663, 1594, 1530, 1405, 1316, 1292, $1172 \mathrm{~cm}^{-1}$; keto tautomer (77\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 12.72$ (s, 2 H ), $10.45(\mathrm{~s}, 2 \mathrm{H}), 7.90(\mathrm{~d}, 4 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.68(\mathrm{~d}, 4 \mathrm{H}, J=8.7 \mathrm{~Hz}), 3.67(\mathrm{~s}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }_{6}, 100 \mathrm{MHz}\right) \delta$ 199.0, 166.9 (2 C), 165.1 (2 C), 142.8 (2 C), 130.5 (4 C), 125.4 (2 C), 118.4 (4C), 51.8 (2 C); distinguished resonances for enol tautomer (23\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}$, 300 MHz ) $\delta 13.75$ (br-s, 1 H ), 10.53 (s, 1 H ), $5.40(\mathrm{~s}, 1 \mathrm{H}), 3.39(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (DMSO- ${ }_{6}$, $100 \mathrm{MHz}) \delta 170.8,170.5,166.2,118.8,93.3,43.5$.

292

$N_{1}, N_{3}$-Bis(4-(carbethoxy)phenyl)malonamide (292, DMA-NB245-80). ${ }^{113}$ To a solution of ethyl 4-aminobenzoate ( $882 \mathrm{mg}, 5.24 \mathrm{mmol}$ ) in THF ( 15 mL ) cooled to $0{ }^{\circ} \mathrm{C}$ was added malonyl chloride ( $0.250 \mathrm{~mL}, 2.49 \mathrm{mmol}$ ) in one portion and the reaction mixture turned heterogeneous and light yellow in color. After stirring at $0{ }^{\circ} \mathrm{C}$ for $5 \mathrm{~min}, \mathrm{~K}_{2} \mathrm{CO}_{3}$ ( $861 \mathrm{mg}, 6.23 \mathrm{mmol}$ ) was added, the ice bath was removed, the reaction mixture was warmed to room temperature for 2 h and was then diluted with EtOAc ( 100 mL ) and washed with $1.0 \mathrm{M} \mathrm{HCl}(2 \mathrm{X} 100 \mathrm{~mL})$ followed by a saturated brine solution (2 X 100 mL ). The EtOAc layer was then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated by rotary evaporation ( $40^{\circ} \mathrm{C}$ ). The resulting light yellow solids were dissolved in
boiling EtOAc ( 100 mL ) and then hexanes $(100 \mathrm{~mL})$ was added to precipitate the product. The resulting suspension was slowly cooled to room temperature and then to $-5{ }^{\circ} \mathrm{C}$ for 3 h . The fluffy white precipitate was isolated by vacuum filtration, washed with hexanes ( 50 mL ) and dried in vacuo to afford 292 ( $819.9 \mathrm{mg}, 83 \%$ ): ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}, 300 \mathrm{MHz}$ ) $\delta 10.55(\mathrm{~s}, 2 \mathrm{H}), 7.93(\mathrm{~d}$, $4 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.74(\mathrm{~d}, 4 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.28(\mathrm{q}, 4 \mathrm{H}, J=7.2 \mathrm{~Hz}), 3.57(\mathrm{~s}, 2 \mathrm{H}), 1.31(\mathrm{t}, 6 \mathrm{H}, J$ $=7.2 \mathrm{~Hz})$; MS (EI) m/z 398 (M

$N_{1}, N_{3}$-Bis(4-benzoic acid)malonamide (293, DMA-NB245-85). ${ }^{113}$ To a suspension of 292 ( $250 \mathrm{mg}, 0.627 \mathrm{mmol}$ ) in dioxane ( 20 mL ) was added a 1.0 M LiOH solution ( 20 mL ) at room temperature. The resulting homogenous yellow reaction mixture was stirred at room temperature for 2.5 h , cooled to $0{ }^{\circ} \mathrm{C}$ and acidified with concentrated $\mathrm{HCl}(10 \mathrm{~mL}$, reaction $\mathrm{pH}=0)$. After 1 h at $0^{\circ} \mathrm{C}$, a white solid precipitated from the mixture which was isolated by vacuum filtration, washed with deionized water ( 30 mL ) and recrystallized from boiling $\mathrm{MeOH}(50 \mathrm{~mL}$ ). After slowly cooling the suspension to room temperature, the recrystallized solid was isolated by vacuum filtration, washed with $\mathrm{MeOH}(10 \mathrm{~mL})$ and dried in vacuo to afford 293 ( $45.8 \mathrm{mg}, 21 \%$, ~93\% pure). This sample was recrystallized a second time from boiling MeOH ( 20 mL ) to afford 293 as a white crystalline solid (17.1 mg, 8\%): ${ }^{1} \mathrm{H}$ NMR (DMSO- $\mathrm{d}_{6}, 300 \mathrm{MHz}$ ) $\delta 12.73$ (s, 2 H ), 10.50 (s, 2 H ), 7.91 (d, $4 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 7.72 (d, $4 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ), 3.56 (s, 2 H ); MS (EI) m/z $342\left(\mathrm{M}^{+}, 42\right), 149$ (100).

Diethyl 4,4'-carbonylbis(azanediyl)dibenzoate (294, DMA-NB245-86). ${ }^{115}$ To a solution of ethyl 4-isocyanatobenzoate ( $300 \mathrm{mg}, 1.57 \mathrm{mmol}$ ) in anhydrous ether ( 20 mL ) was added ethyl 4aminobenzoate ( $259 \mathrm{mg}, 1.57 \mathrm{mmol}$ ) in one portion. The resulting homogeneous reaction mixture became cloudy after $\sim 1 \mathrm{~h}$ and a clear crystalline solid precipitated slowly over 40 h . At this time, the reaction mixture was further diluted with ether ( 15 mL ), stirred at room temperature for 15 min and vacuum filtered. The resulting white solid was isolated by vacuum filtration, washed with ether ( 15 mL ) and dried in vacuo to afford $294(327 \mathrm{mg}, 58 \%):{ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }_{6}, 300 \mathrm{MHz}\right) \delta 9.19(\mathrm{~s}, 2 \mathrm{H}), 7.90(\mathrm{~d}, 4 \mathrm{H}, J=8.7 \mathrm{~Hz}), 7.60(\mathrm{~d}, 4 \mathrm{H}, J=8.7 \mathrm{~Hz}), 4.28$ (q, $4 \mathrm{H}, J=7.2 \mathrm{~Hz}$ ), 1.30 (t, $6 \mathrm{H}, J=7.2 \mathrm{~Hz}$ ); MS (EI) m/z 356 (M+, 21), 311 (9), 165 (66), 120 (100).

295

4,4'-Carbonylbis(azanediyl)dibenzoic acid (295, DMA-NB245-87). ${ }^{115}$ To a suspension of 294 (220 mg, 617 mmol ) in dioxane ( 10 mL ) was added a 2.0 M LiOH solution ( 10 mL ) at room
temperature. The heterogeneous reaction mixture was stirred at room temperature for 8 h , cooled to $0{ }^{\circ} \mathrm{C}$ and acidified with concentrated HCl to pH 0 . The resulting turbid solution was cooled to $-5{ }^{\circ} \mathrm{C}$ for 18 h . The white precipitate was isolated by vacuum filtration, triturated with boiling MeOH (200 mL) for 1 h and dried in vacuo to afford $295 \sim 7 \%$ solvated with dioxane (164 mg, $88 \%):{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{DMSO}_{\mathrm{d}}, 300 \mathrm{MHz}\right) \delta 12.63(\mathrm{~s}, 2 \mathrm{H}), 9.24(\mathrm{~s}, 2 \mathrm{H}), 7.88(\mathrm{~d}, 4 \mathrm{H}, \mathrm{J}=8.7 \mathrm{~Hz})$, 7.58 (d, $4 \mathrm{H}, J=8.7 \mathrm{~Hz}$ ).

SID 861574. LC/MS/UV data: Phenomenex $\mathrm{C}_{18}(4.6 \mathrm{X} 100 \mathrm{~nm})$ column, $1.0 \mathrm{~mL} / \mathrm{min}, 254 \mathrm{~nm}$, gradient elution with 15 to $45 \%$ acetonitrile in water containing $0.10 \%$ TFA, 1 mg sample $/ \mathrm{mL}$ DMSO; Retention time $=16.92 \mathrm{~min} ; \mathrm{MS}(\mathrm{ESI}+) \mathrm{m} / \mathrm{z} 320[\mathrm{M}+\mathrm{H}]^{+} . \mathrm{X}$-Ray crystal structure: A 2.5 mg sample of SID 861574 was dissolved in a $1: 1$ mixture of $\mathrm{MeOH}: \mathrm{ACN}(1.0 \mathrm{~mL})$. The solvent was slowly evaporated at $5{ }^{\circ} \mathrm{C}$ over several months and the resulting orange crystals were used for X-Ray crystallographic analysis.

## APPENDIX A

## A. 1 X-RAY CRYSTALLOGRAPHIC DATA FOR SID 861574

Figure 22. X-Ray crystal structure of SID 861574

Table 1. Crystal data and structure refinement for daw1016.

| Identification code | daw1016 |
| :---: | :---: |
| Empirical formula | C15 H13 N O7 |
| Formula weight | 319.26 |
| Temperature | 203(2) K |
| Wavelength | 0.71073 Å |
| Crystal system | Monoclinic |
| Space group | C2/c |
| Unit cell dimensions | $a=21.011(7) \AA$ A $\quad a=90^{\circ}$. |
